In no event shall the World Health Organization or its Regional Office for Africa be liable for damages arising from its use.

This Atlas has been prepared by a core team from the Health Systems and Services Cluster of WHO Regional Office for Africa under the general guidance of the Cluster Director. The core team was coordinated by Derege Kebede and included Harris Benito Koubemba Mona, Davy Audrey Liboko Gnekabassa, Monde Mambimongo Wangou, Anaclet Geraud Nganga Koubemba and Berence Relisy Ouaya Bouesso. It was reviewed by Peter Mbondji Ebongue, Miguel Mesquita de Oliveira Peixoto, Wenceslas H. Kouvidila and Yves Turgeon. Specific sections of the Atlas were also reviewed by the relevant technical programmes and units in the Regional Office. The assistance of Marcelline Itoua is also acknowledged.

Message from the Regional Director	xvii
Overview of the profile of the African Region	xviii
1. Introduction to country context	1
2. Health status and trends	3
2.1. Life expectancy	3
2.2. Mortality	8
2.3. Burden of disease	17
3. The health system	19
3.1. Health system outcomes	19
3.2. Leadership and governance	29
3.3. Partnership for health development	32
3.4. Health information	33
3.5. Research	34
3.6. Health financing	35
3.7. Service delivery	43
3.8. Health workforce	44
3.9. Medical products, vaccines, infrastructures and equipment	47
3.10. Universal coverage	52
4. Specific programmes and services	54
4.1. HIV/AIDS	54
4.2. Tuberculosis	62
4.3. Malaria	67
4.4. Immunization, vaccines and emergencies	70
4.5. Child and adolescent health	78
4.6. Maternal and newborn health	89
4.7. Gender and women's health	95
4.8. Ageing	101
4.9. Epidemic and pandemic-prone diseases	103
4.10. Neglected tropical diseases	111
4.11. Noncommunicable diseases and conditions	115
5. Key determinants	120
5.1. Risk factors for health	120
5.2. The physical environment	124
5.3. Food safety and nutrition	128
5.4. Social determinants	131
6. Progress on the MDGs	144
6.1. MDG-4: Reduce child mortality	144
6.2. MDG-5: Improve maternal health	146
6.3. MDG-6: Combat HIV/AIDS, malaria and other diseases	150
6.4. MDG-7: Ensure environmental sustainability	154
6.5. MDG-1: Eradicate extreme poverty and hunger	156
6.6. MDG-2: Achieve universal primary education	157
6.7. MDG-3: Promote gender equality and empower women	157
6.8. MDG-8: Develop a global partnership for development	158
7. Explanatory notes	160

Message from the Regional Director

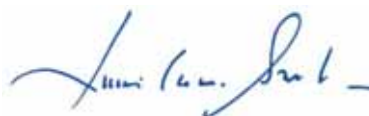

The *Atlas of Health Statistics, 2014*, which provides a health situation analysis of WHO's African Region, is the most significant data output of the African Health Observatory (www.aho.afro.who.int). Now in its third edition, the *Atlas* is building on the ground-breaking work that was carried out in preparing the initial edition. Not only it has been updated for 2014, but its coverage has expanded and further indicators have been included. Another new development is the presence of the *Atlas* on the African Health Observatory web portal. It is being launched not merely as an electronic document, but as interactive web pages within the Observatory, allowing users to carry out searches and conduct analyses of their own. We aim to develop the *Atlas* on an ongoing basis, expanding its reach, indicators and accuracy as we go.

Of course all the data comes from the countries, and we are entirely reliant on data collection, cleaning, correction, evaluation and assessment carried out first of all at country level in each of the 47 Member Countries of WHO's African Region. These data are further reviewed and refined in WHO, both in its African country offices and Regional Office, and by technical experts at WHO headquarters in Geneva. Mortality estimates that are used to monitor internationally agreed goals, such as the MDGs, are produced by inter-agency groups consisting of members from WHO, UNICEF, and World Bank among others. The results of this system of analysis are data which is good for comparison of countries but which may not agree with estimates at country level. The figures are computed by WHO to ensure comparability; they are not necessarily the official statistics of Member States, which may use alternative valid methods. The *Atlas* also used data from other sources, including other UN sister agencies. Another source, especially for the data on morbidity was the 2010 Global Burden of Diseases Analyses that was undertaken by Institute of Health Metrics and Evaluation at the University of Washington.

Looking back to the raw inputs, however, it is clear that the quality, quantity, frequency of collection, and timeliness of data depends very much on the strength of the national health information systems, which include data collection at the district and peripheral levels. With some notable exceptions, this has been an area of weakness within most national health systems. By and large, the development of national health information systems has been slow and uneven, despite many efforts over the years.

WHO seeks to support countries in strengthening their national health information systems, and one mechanism that is being developed in response to demands from the countries is the establishment of a network of national health observatories. With support from WHO's Regional Office for Africa, a number of countries have taken steps to set up such observatories, often with direct links to the district level, as a way to reinforce the national health information system. The national observatories also link to the African Health Observatory, in a collaborative, two-way system of information, evidence and knowledge exchange. Such observatories serve at both the regional and national levels as platforms for other activities designed to foster monitoring and evaluation, which are essential components of the cycle of development and policy work that lead to national health policies and health development plans.

Thus, the collaborative networking approach embraced by the African Health Observatory and the national observatories is intended to provide a continuum between work at the regional and national levels, offering a platform for many disparate supporting mechanisms and methodologies. This should lead to a marked decrease of the fragmentation of efforts so frequently found in public health policy and development work. The *Atlas* is a product and promoter of such collaborative networking.

Dr Luis Gomes Sambo
Regional Director
WHO - Regional Office for Africa

African Region Statistical Profile : Overview

Figure A: The WHO African Region

Table: General population characteristics

		African Region	Global
Population size (in thousands)	2012	892,696	7,053,835
	2011	857,382	6,941,907
Population living in urban areas (%)	2011	38	52
	2000	34	50
Life expectancy at birth (years)	2011	56	70
	1990	50	64
Adult mortality rate (probability of dying between 15 and 60 years per 1000 population)	2011	339	160
	1990	377	204
Per capita total expenditure on health (PPP int. \$)	2011	161	1,079
	2000	87	565
	1995	75	447
Gross national income per capita (PPP.int\$)	2011	2,510	11,540
	2000	1,620	6,980

Health
Observatory

Better information, better action on health

MDG-4 : Reduce child mortality

Target 4 A : Reduce by two thirds, between 1990 and 2015, the under-five mortality rate

Figure I: Trend in under-5 mortality rate (probability of dying by age 5; per 1,000 live births) in the African Region, 1990-2012 and the MDG Target 2015

Figure J: The annual average rate of reduction (AARR %) in under-5 mortality rate, between 1990 and 2012

Figure K: Trend in Measles-containing vaccine (MCV) immunization coverage among 1-year-olds (%) in the African Region, 1980-2012

Figure L: Measles-containing vaccine (MCV) immunization coverage among 1-year-olds (%), 1990 and 2012

MDG-5 : Improve maternal health

Target 5 A : Reduce by three quarters, between 1990 and 2015, the maternal mortality rate

Target 5 B: Achieve, by 2015, universal access to reproductive health

Figure M: Trend in maternal mortality ratio (per 100,000 live births) in the African Region, 1990-2010 and the MDG Target 2015

Figure N: Annual average rate of reduction (AARR %) in maternal mortality ratio, between 1990 and 2010

Figure O: Percentage of births attended by skilled (SBA) health personnel

Figure P: Percentage of unmet need for family planning, 2005-2012

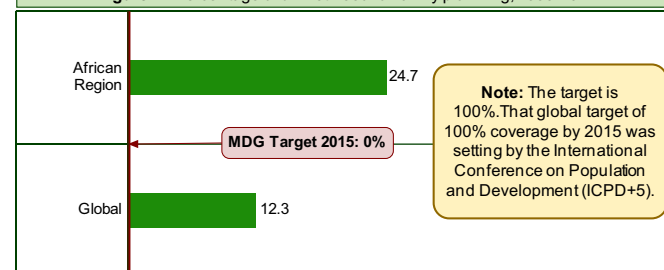

Figure Q: Percentage of Antenatal care coverage at least one visit (ANC1), 2005-2012

Figure R: Percentage of Antenatal care coverage at least four visits (ANC4), 2005-2012

African Region Statistical Profile : Progress on the MDGS

African
Health
Observatory

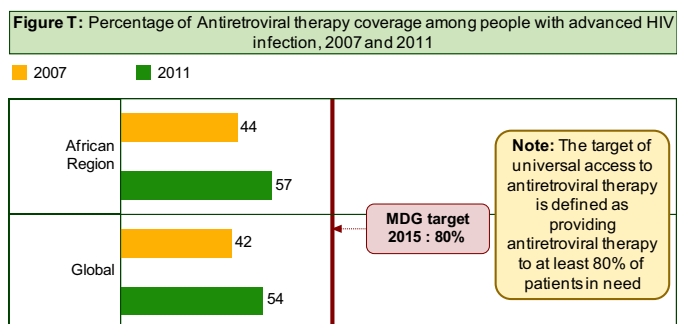

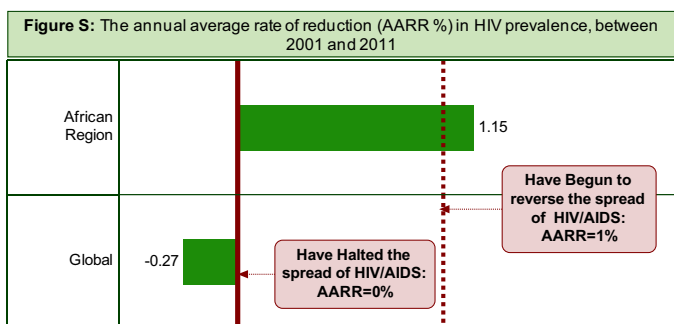

Better information, better action on health

MDG-6: Combat HIV/AIDS, malaria and other diseases

Target 6 A: Have halted by 2015 and begun to reverse the spread of HIV/AIDS

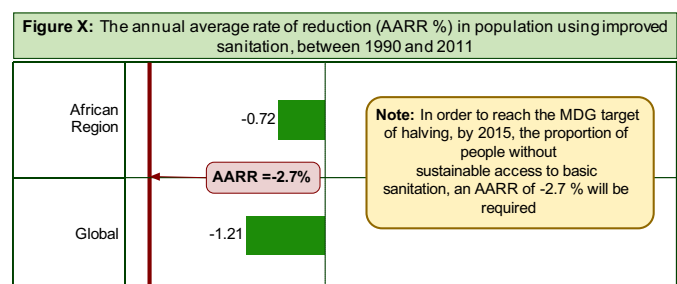

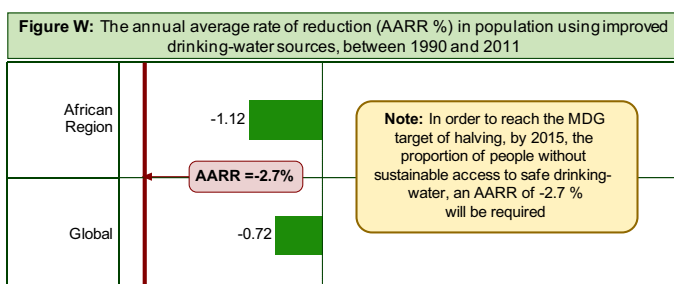

Target 6 B: Achieve, by 2010, universal access to treatment for HIV/AIDS for all those who need it

Target 6 C: Have halted by 2015 and begun to reverse the incidence of malaria and other major diseases

MDG-7 : Ensure environmental sustainability

Target 7C : Halve, by 2015, the proportion of people without sustainable access to safe drinking water and basic sanitation

MDG-1 : Eradicate extreme poverty and hunger

Target 1C : Halve, between 1990 and 2015, the proportion of people who suffer from hunger

1. Introduction

Figure 1.1: WHO Regions

- African Region
- Eastern Mediterranean Region
- European Region
- Region of the Americas
- South-East Asia Region
- Western Pacific Region

The African Region is one of the six regions (see figure 1.1) in which the World Health Organization (WHO) collaborates with countries in public health. With over 892 millions inhabitants in 47 countries (see figure 1.2), it accounts for about one seventh of the world's population. This statistical atlas describes the health status and trends in the countries of the African Region, the various components of their health systems, coverage and access levels for specific programmes and services, and the broader determinants of health in the Region, and the progress made on reaching the Millennium Development Goals (MDGs).

Each indicator is described, as appropriate, by place (WHO regions and countries in the African Region), person (age and sex) and time (various years) using a bar graph. The aim is to give a comprehensive overview of the health situation in the African Region and its 47 Members States.

The main source for the data is WHO-AFRO's integrated database based on the World Health Statistics 2013. Other UN agency databases have been used when necessary. All the data and figures in this Atlas can be accessed through the African Health Observatory (www.aho.afro.who.int).

Source: WHO, November 2013.

Figure 2.3.5: Total burden of disease in DALYs per 1,000 population by WHO Region, 2004

Source: WHO, November 2013.

*The disability-adjusted life-year (DALY) provides a consistent and comparative description of the burden of diseases and injuries needed to assess the comparative importance of diseases and injuries in causing premature death, loss of health and disability in different populations. The DALY extends the concept of potential years of life lost due to premature death to include equivalent years of 'healthy' life lost by virtue of being in states of poor health or disability. One DALY can be thought of as one lost year of 'healthy' life, and the burden of disease can be thought of as a measurement of the gap between current health status and an ideal situation where everyone lives into old age, free of disease and disability. WHO. Burden of Diseases Update 2004. Geneva, July 2008.

6. Progress on the MDGs

6.1 MDG-4 : Reduce child mortality

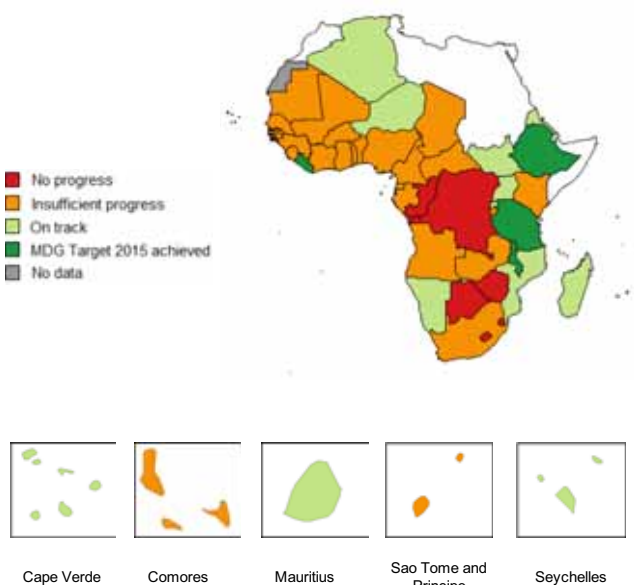

6.1.1 Target 4.A : Reduce by two thirds, between 1990 and 2015, the under-five mortality rate

Figure 6.1.1.1: Under-5 mortality rate (per 1000 live births) in WHO Regions, both sexes, 1990 and 2012

Source : World Health Statistics 2013, Geneva: WHO, 2013

Figure 6.1.1.3: Classification of countries according to the achievement of the MDG Target on under-5 mortality in the African Region, 1990 and 2012

Source : WHO, UNICEF, UNFPA, and World Bank, May 2013

Four countries have achieved the MDG Target 2015 of Reducing by two thirds, between 1990 and 2015, the under-five mortality rate: **Ethiopia, Liberia, Malawi and Tanzania**

Notes:

WHO, World Health Statistics 2013, Geneva World Health Organization, 2013.
 Country and regional assessments of progress towards MDG 4 are based on average annual rates of reduction (AARR) in U5MR observed for 1990-2012 and required during 2013-2015 in order to reach the MDG target of reducing U5MR by two thirds by 2015, according to the following thresholds: **On track:** U5MR is less than 40, or U5MR is 40 or more and AARR observed for 1990-2012 is 4.0 per cent or more. **Insufficient progress:** U5MR is 40 or more and AARR observed for 1990-2012 is between 1.0 per cent and 3.9 per cent. **No progress:** U5MR is 40 or more and AARR observed for 1990-2012 is less than 1.0 per cent.

Figure 6.1.1.2: Under-5 mortality rate (per 1000 live births) in the African Region, by country, 2012, the MDG target 2015 and the Annual average rate of reduction (AARR %), between 1990 and 2012

Health MDGs

6.2 MDG-5 : Improve maternal health

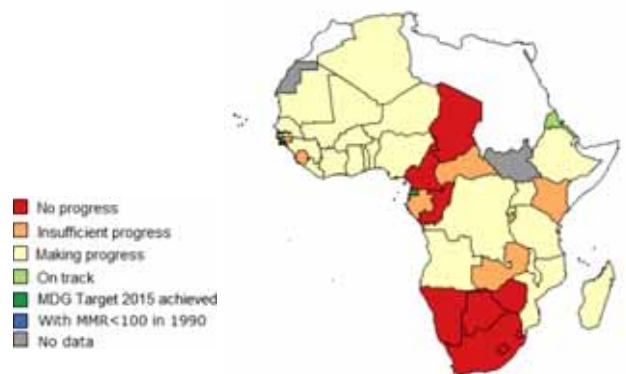

6.2.1 Target 5.A: Reduce by three quarters, between 1990 and 2015, the maternal mortality ratio

Figure 6.2.1.1: Maternal mortality ratio (per 100 000 live births) in WHO Region in 2010

Source : World Health Statistics 2013. Geneva: WHO, 2013

Figure 6.2.1.3: Classification of countries according to the achievement of the MDG Target on maternal mortality ratio in the African Region, 1990 and 2010

Source : WHO, UNICEF, UNFPA, and World Bank, May 2013

One country has achieved the MDG target of Reducing by three quarters, between 1990 and 2015, the maternal mortality ratio: **Equatorial Guinea**

Notes:

Trends in Maternal mortality:1990 to 2010: Estimates developed by WHO, UNICEF, UNFPA and the World Bank, WHO, 2010 and WHO, World Health Statistics 2013, Geneva, World Health Organization 2013.

Countries with MMR≥100 in 1990 are categorized as “on track” if there has been 5.5% decline or more annually, “making progress” if MMR has declined between 2% and 5.5%, making “insufficient progress” if MMR has declined by less than 2% annually, and having “no progress” if there has been no decline in MMR. No data available for Seychelles. Mauritius with MMR<100 in 1990 is not categorized.

Figure 6.2.1.2: Maternal mortality ratio (per 100 000 live births) in the African Region, 2010 the MDG target 2015 and the Annual average rate of reduction (AARR, 1990 and 2010)

Source : World Health Statistics 2013. Geneva: WHO, 2013

There are currently no countries that have achieved the MDG Target 2015.

Notes:

Achieving the MDG target of universal access to reproductive health by 2015 can be interpreted as 0% unmet need.

Figure 6.2.2.5: Percentage of Unmet need for family planning, in the African Region, 1990-1999, 2005-2012 and the MDG target 2015

Countries of the African Region without data are not included in the chart.

Source : World Health Statistics 2013. Geneva: WHO, 2013

Health MDGs

6.3 MDG-6 : Combat HIV/AIDS, malaria and other diseases

6.3.1 Target 6.A: Have halted by 2015 and begun to reverse the spread of HIV/AIDS

Figure 6.3.1.1: Percentage of people 15-49 years of age living with HIV, by WHO Region, 2001 and 2011

Source : World Health Statistics 2013. Geneva: WHO, 2013

Figure 6.3.1.3: Classification of countries according to the achievement of the MDG Target on Percentage of people 15-49 years of age living with HIV, in the African Region, 2001-2011

Source : World Health Statistics 2013. Geneva: WHO, 2013

Twenty three countries have achieved the MDG target of having halted and begun to reverse the spread of HIV/AIDS by 2015: **Algeria, Benin, Botswana, Burkina Faso, Burundi, Central African Republic, Chad, Comoros, Congo, Côte d'Ivoire, Eritrea, Ethiopia, Ghana, Kenya, Liberia, Malawi, Mali, Namibia, Rwanda, Togo, Tanzania, Zambia and Zimbabwe**

Notes:

The MDG target to halt by 2015 and begin to reverse the spread of HIV/AIDS can be interpreted as any AARR greater than 0%. That target corresponds to an AARR of 0% with cut-off points of +10% (AARR of 1% and more).

Figure 6.3.1.2 : Percentage of people 15-49 years of age living with HIV in the African Region, 2001 , 2011 and the Annual average rate of reduction (AARR %), between 2001 and 2011)

Countries of the African Region without data are not included in the chart.

Figure 6.3.2.3: Classification of countries according to the achievement of the MDG Target on Percentage of Antiretroviral therapy coverage among people with advanced HIV infection, in the African Region, 2011

■ Access: Less than 60%
■ Access: between 60% and 79%
■ MDG Target 2015 achieved
■ No data

Source : World Health Statistics 2013. Geneva: WHO, 2013

Five countries have achieved the MDG target 2015 of universal access to treatment for HIV/AIDS for all those who need it:

Botswana, Namibia, Rwanda, Swaziland and Zambia

Notes:

The target of universal access to antiretroviral therapy is defined as providing antiretroviral therapy to at least 80% of patients in need (standards for treatment set out in the 2010 guidelines of the Joint United Nations Programme on HIV/AIDS).

Figure 6.3.2.2 : Percentage of Antiretroviral therapy coverage among people with advanced HIV infection in the African Region, 2007, 2011 and the MDG target 2015

Countries of the African Region without data are not included in the chart.

Source : World Health Statistics 2013. Geneva: WHO, 2013

Health MDGs

6.3 MDG-6 : Combat HIV/AIDS, malaria and other diseases

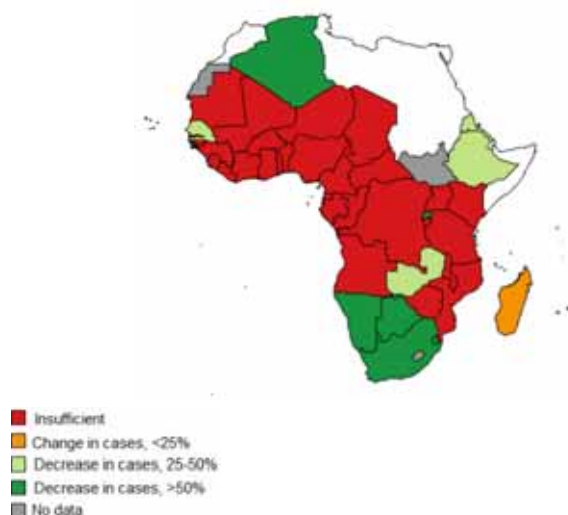

6.3.3 Target 6.C: Have halted by 2015 and begun to reverse the incidence of malaria and other major diseases

Figure 6.3.3.1: Percentage of Malaria incidence reduction, by WHO Region, 2000-2010 and the MDG target 2015

Source : World Malaria Report, 2013.

Figure 6.3.3.3: Classification of countries according to the achievement of the MDG Target on Malaria incidence reduction in the African Region, 2000-2010

Source : World Malaria Report, 2013.

There are currently no countries that have achieved the MDG Target 2015. However, eight countries are on track to achieve that target : *Algeria, Botswana, Cape Verde, Namibia, Rwanda, Sao Tome and Principe, South Africa and Swaziland*

Notes:

The World Health Assembly target is to achieve a 75% reduction in malaria case incidence rates by 2015, compared to levels in 2000. A 75% reduction in malaria case incidence is equivalent to a 5 percentage point reduction against the baseline per year between 2000 and 2015. Thus, to be on track to achieve the targets, countries need to have reduced the incidence of malaria by at least 60% between 2000 and 2012.

Figure 6.3.3.2 : Percentage of children under 5 years of age sleeping under insecticide-treated bed nets and the Percentage of children under 5 years of age with fever being treated with antimalarial drugs in the African Region, 2008-2012

Health MDGs

6.3 MDG-6 : Combat HIV/AIDS, malaria and other diseases

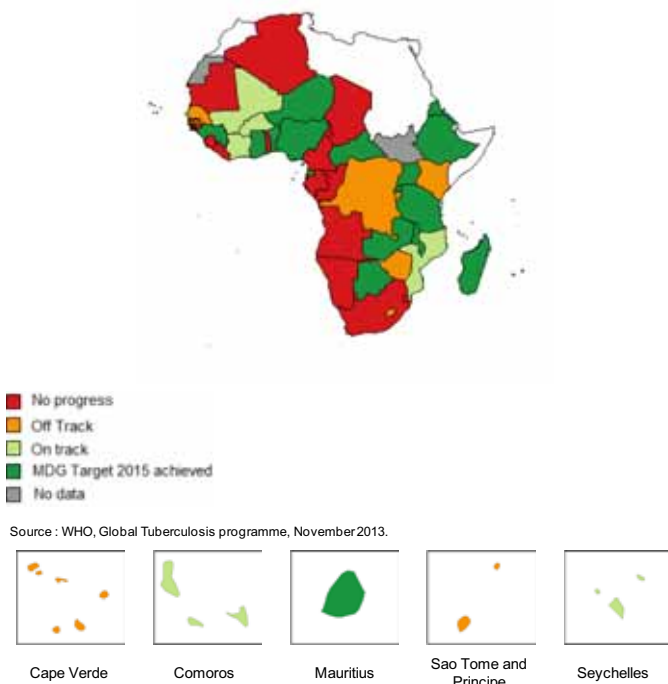

6.3.3 Target 6.C: Have halted by 2015 and begun to reverse the incidence of malaria and other major diseases

Figure 6.3.3.4: Tuberculosis mortality rate (per 100 000 population per year) among HIV-negative people, by WHO Region, 1990 and 2012

Source : WHO, Global Tuberculosis programme, November 2013.

Figure 6.3.3.6: Classification of countries according to the achievement of the MDG Target on Tuberculosis mortality rate (per 100 000 population per year) among HIV-negative people in the African Region, 1990-2012

Seventeen countries have achieved the MDG Target of a 50% reduction between 1990 and 2015:

Benin, Botswana, Central African Republic, Equatorial Guinea, Eritrea, Ethiopia, Ghana, Guinea, Madagascar, Malawi, Mauritius, Niger, Nigeria, Rwanda, Tanzania, Uganda and Zambia

Notes:

In order to reach the target of a 50% reduction of mortality rate of tuberculosis between 1990 and 2015 set by the Stop TB Partnership, an AARR of 2.7% is needed. Thus,

On track: if AARR >= 2.7%

Off track: if AARR < 2.7%. However, an AARR < 0 means **no progress**.

Figure 6.3.3.5: Tuberculosis mortality rate (per 100 000 population per year) among HIV-negative people and the Annual average rate of reduction (AARR %), between 1990 and 2012, in the African Region

■ No progress
■ Insufficient progress
■ On track
■ MDG Target achieved
■ No data

Source : World Health Statistics 2013. Geneva: WHO, 2013

Eleven countries have achieved the MDG Target of a 50% reduction between 1990 and 2015:
Botswana, Burkina Faso, Gambia, Ghana, Guinea-Bissau, Malawi, Mali, Mauritius, Namibia, Swaziland and Uganda

Notes:

In order to reach the MDG target of halving, by 2015, the proportion of people without Sustainable access to safe drinking-water sources, an AARR of -2.7 % will be required. If use of improved sources of drinking water in 2011 was below the rate needed for the country to reach the MDG target for: Less than 5% , or use was 95% or higher (**On track**)
 : 5% to 10% (**Insufficient progress**)
 : More than 10% or the 1990-2011 trend shows unchanged or decreasing use (**No progress**)

Countries of the African Region without data are not included in the chart.

Figure 6.5.1.3: Classification of countries according to the achievement of the MDG Target on Percentage of underweight children under 5 years of age in the African Region, 1990-2012

Source : UNICEF, 2013

There are currently no countries that have achieved the MDG Target 2015. However, ten countries are on track to reach that target: *Angola, Benin, Ghana, Liberia, Malawi, Mauritania, Mozambique, Rwanda, Swaziland and Tanzania*

Notes:

In order to reach the MDG target of halving, by 2015, the proportion of people who suffer from hunger, an AARR of 2.7 % is needed.

Thus, countries are classified as:

On track: if AARR in underweight prevalence is greater than or equal to 2.6% or latest available estimate of underweight prevalence is less than or equal to 5% regardless of AARR. **Insufficient progress:** AARR is between 0.6% and 2.5%. **No progress:** AARR is less than or equal to 0.5%

Figure 6.5.1.2: Percentage of underweight children under 5 years of age in the African Region, 2005-2012, the MDG target 2015 and the Annual average rate of reduction (AARR %), between 1990 and 2012

Source : UNICEF, 2013

Countries of the African Region without data are not included in the chart.

Other MDGs

6.6 MDG-2 : Achieve Universal Primary Education

6.6.1 Target 2.A: Ensure that, by 2015, children everywhere, boys and girls alike, will be able to complete a full course of primary schooling

Figure 6.6.1.1: Percentage of net enrolment ratio in primary education, in the African Region, 2007-2012 and the MDG target 2015

Source: UNESCO, 2013

Countries of the African Region without data are not included in the chart.

■ No progress
■ Insufficient progress
■ On track

Notes:

Countries were classified based on their total primary net enrolment ratio or net attendance ratio (NE/AR). **On track:** Latest available NE/AR or projected NE/AR for 2015 is greater than or equal to 95 per cent. **Insufficient progress:** Latest available NE/AR is greater than or equal to 90 per cent and less than 95 per cent and projected NE/AR for 2015 is less than 95 per cent; or latest available NE/AR is less than 90 per cent and projected NE/AR for 2015 is greater than or equal to 90 per cent and less than 95 per cent. **No progress:** Latest available NE/AR is less than 90 per cent and projected NE/AR for 2015 is less than 90 per cent.

6.7 MDG-3 : Promote Gender Equality And Empower Women

6.7.1 Target 3.A: Eliminate gender disparity in primary and secondary education, preferably by, 2005, and in all levels of education no later than 2015

Figure 6.7.1.1: The gender parity index in percentage of net enrolment ratio in primary education in the African Region, 2007-2012

Source: UNESCO, 2013

Countries of the African Region without data are not included in the chart.

■ Insufficient progress
■ On track

Notes:

The gender parity index (GPI) is obtained by dividing the net enrolment rates for girls by the net enrolment rates for boys. GPI of 0.96 to 1.04 means that the percentages of boys and girls in school are roughly equal. GPI of more than 1.04 means that the percentage of girls in school is higher than the percentage of boys in school. GPI of less than 0.96 means that the percentage of boys is higher than the percentage of girls in school. Countries are classified based on their gender parity index. **On track:** Latest available GPI is greater than or equal to 0.96 and less than or equal to 1.04. **Insufficient progress:** Latest available GPI is less than 0.96 or greater than 1.04.

Other MDGs

6.8 MDG-8 : Develop a global partnership for development

6.8.1 Target 8.A: Develop further an open, rule-based, non discriminatory trading and financial system

Figure 6.8.1.1 : Official development assistance (ODA) received as percentage of GDP in the African Region, by country, 2011

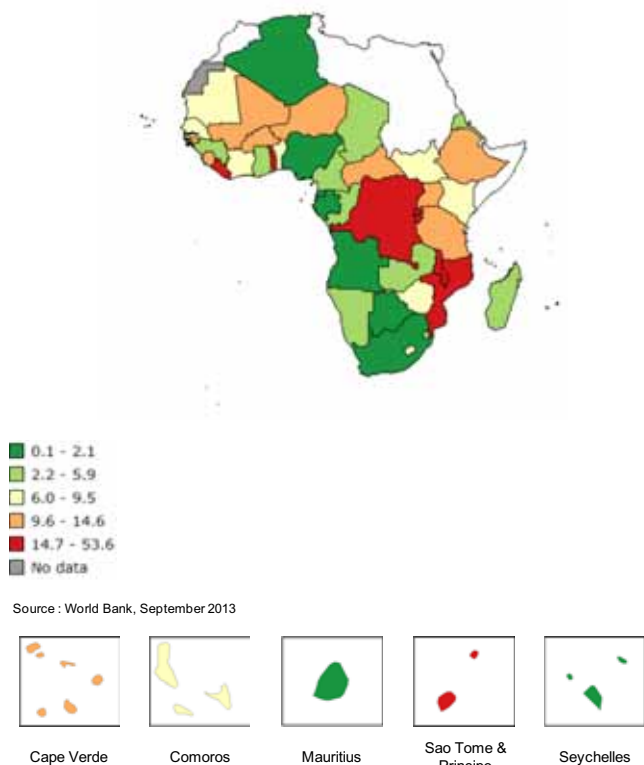

Figure 6.8.1.3 : Trade (% of GDP) in Sub-Saharan Africa, 1990-2012

Figure 6.8.1.2 : Total debt service as percentage of exports of goods, services and income in the African Region, by country, 1990 and 2010

Other MDGs

6.8 MDG-8 : Develop a global partnership for development

6.8.2 Target 8.F: In cooperation with the private sector, make available the benefits of new technologies, especially information and communications

Figure 6.8.2.1: Percentage of the population who are Internet users in the African Region, 2012

Source : World Bank, September 2013

Countries of the African Region without data are not included in the chart.

Figure 6.8.2.2 : Percentage of population who are cellular or mobile subscribers in the African Region, 2012

Source : World Bank, September 2013

Countries of the African Region without data are not included in the chart.

7. Explanatory notes

The following provides the definition of the health statistics categories included in this volume, as well as the rationale for their inclusion and the estimation methods used in their production.

Health status

1. Life expectancy at birth

Rationale for use: Life expectancy at birth reflects the overall mortality level of a population. It summarizes the mortality pattern that prevails across all age groups, children and adolescents, adults and the elderly.

Definition: Average number of years that a newborn is expected to live if current mortality rates continue to apply.

Methods of estimation: WHO has developed a model life table based on about 1800 life tables from vital registration judged to be of good quality. For countries with vital registration, the level of completeness of recorded mortality data in the population is assessed and mortality rates are adjusted accordingly. Where vital registration data for 2003 were available, these were used directly to construct the life table. For countries where the information system provided a time series of annual life tables, parameters from the life table were projected using a weighted regression model, giving more weight to recent years. Projected values of the two life table parameters were then applied to the modified logit life table model, where the most recent national data provided an age pattern, to predict the full life table for 2003. In case of inadequate sources of age-specific mortality rates, the life table is derived from estimated under-5 mortality rates and adult mortality rates that are applied to a global standard (defined as the average of all the 1800 life tables using a modified logit model).

Source: Life Tables for WHO Member States. Geneva, WHO, 2010.

Available at: www.who.int/whosis/database/life_tables/life_tables.cfm.

2. Healthy life expectancy (HALE)

Rationale for use: Substantial resources are devoted to reducing the incidence, duration and severity of major diseases that cause morbidity but not mortality and to reducing their impact on people's lives. It is important to capture both fatal and nonfatal health outcomes in a summary measure of average levels of population health. Healthy life expectancy (HALE) at birth adds up expectation of life for different health states, adjusted for severity distribution, making it sensitive to changes over time or differences between countries in the severity distribution of health states.

Definition: Average number of years that a person can expect to live in 'full health' by taking into account years lived in less than full health due to disease and/or injury.

Methods of estimation: Since comparable health state prevalence data are not available for all countries, a four-stage strategy is used. Data from the WHOGBD study are used to estimate severity adjusted prevalence by age and sex for all countries. Data from the WHOMCSS and WHS are used to make independent estimates of severity-adjusted prevalence by age and sex for survey countries. Prevalence for all countries is calculated based on GBD, MCSS and WHS estimates. Life tables constructed by WHO are used with Sullivan's method to compute HALE for countries. HALE estimates use methods described in the statistical annex to the World Health Report 2004. Estimates for 2007 have been revised to take into account the Global Burden of Disease estimates for Member States for the year 2004 and may not be entirely comparable with those for 2002 published in World Health Statistics 2007. Income-group aggregates are based on the 2008 World Bank list of economies.

3. Adult mortality rate (Probability of dying (per 1000) between ages 15 and 60 years)

Rationale for use: Disease burden from noncommunicable diseases among adults – the most economically productive age span – is rapidly increasing in developing countries owing to ageing and health transitions. Therefore, the level of adult mortality is becoming an important indicator for the comprehensive assessment of the mortality pattern in a population.

Definition: Probability that a 15-year-old person will die before reaching his/her 60th birthday. Mortality data: World Health Organization, 2010(www.who.int/healthinfo/statistics/mortality/en/).

4. Under-5 mortality rate (Probability of dying (per 1000) under age 5 years) / Infant mortality rate (Probability of dying (per 1000) under age one year)

Rationale for use: Under-5 and infant mortality rates are leading indicators of the level of child health and overall development in countries. They are also MDG indicators.

Definition: The under-5 mortality rate is the probability of a child born in a specific year or period dying before reaching the age of 5, if subject to age-specific mortality rates of that period. The infant mortality rate is the probability of a child born in a specific year or period dying before reaching the age of one, if subject to age-specific mortality rates of that period.

Methods of estimation: Empirical data from different sources are consolidated to obtain estimates of the level and trend in under-5 mortality by fitting a curve to the observed mortality points. However, to obtain the best possible estimates, judgement needs to be made on data quality and how representative it is of the population. Recent statistics based on data availability in most countries are point estimates dated by at least 3–4 years, which need to be projected forward in order to obtain estimates of under-5 mortality for the current year. Those are then converted to their corresponding infant mortality rates through model life table systems: the one developed by WHO for countries with adequate vital registration data and Coale–Demeny model life tables for the other countries. It should be noted that the infant mortality data from surveys are exposed to recall bias; hence their estimates are derived from under-5 mortality, which leads to a supplementary step to estimate infant mortality rates.

5. Maternal mortality ratio (per 100 000 live births)

Rationale for use: Complications during pregnancy and childbirth are leading causes of death and disability among women of reproductive age in developing countries. The maternal mortality ratio (MMR) represents the risk associated with each pregnancy, i.e. the obstetric risk. It is also an MDG indicator for monitoring Goal 5 of improving maternal health.

Definition: Number of maternal deaths per 100 000 live births during a specified time period, usually one year.

Methods of estimation: Measuring maternal mortality accurately is difficult except where comprehensive registration of deaths and their causes exists. Elsewhere, censuses or surveys can be used to measure levels of maternal mortality. Data derived from health services records are problematic where not all births take place in health facilities, because of biases whose dimensions and direction cannot be determined. Reproductive age mortality studies (RAMOS) use triangulation of different sources of data on deaths of women of reproductive age, including record review and/or verbal autopsy, to accurately identify maternal deaths. Based on multiple sources of information, RAMOS are considered the best way to estimate levels of maternal mortality. Estimates derived from household surveys are usually based on information retrospectively collected about the deaths of sisters of the respondents and could refer back up to an average 12 years, and they are subject to wide confidence intervals. For countries without any reliable data on maternal mortality, statistical models are applied. Global and regional estimates of maternal mortality are developed every 5 years, using a regression model.

(ii) Maternal Mortality in 2005. Estimates Developed by WHO, UNICEF, UNFPA and the World Bank. Geneva: WHO, 2008.

Available at : http://whqlibdoc.who.int/publications/2007/9789241596213_eng.pdf.

6. Age-standardized death rates per 100 000 population by cause

Rationale for use: The numbers of deaths per 100 000 population are influenced by the age distribution of the population. Two populations with the same age-specific mortality rates for a cause of death will have different overall death rates if the age distributions of their populations are different. Age-standardized mortality rates adjust for differences in population age distribution by applying the observed age-specific mortality rates for each population to a standard population.

Definition: The age-standardized mortality rate is a weighted average of the age-specific mortality rates per 100 000 persons, where the weights are the proportions of persons in the corresponding age groups of the WHO standard population. Rates are age-standardized to WHO's World Standard Population. See Age Standardization of Rates: A New WHO Standard. Geneva, WHO, 2001 (GPE Discussion Paper Series No. 31).

Available at: www.who.int/healthinfo/paper31.pdf.

7. Years of life lost (percentage of total)

Rationale for use: Years of life lost (YLL) take into account the age at which deaths occur by giving greater weight to deaths at younger age and lower weight to deaths at older age. The years of life lost (percentage of total) indicator measures the YLL due to a cause as a proportion of the total YLL lost in the population due to premature mortality.

Definition: YLL are calculated from the number of deaths multiplied by a standard life expectancy at the age at which death occurs. The standard life expectancy used for YLL at each age is the same for deaths in all regions of the world and is the same as that used for the calculation of disability-adjusted life-years (DALYs). Additionally, 3% time discounting and non-uniform age weights that give less weight to years lived at young and older ages were used as for the DALY. With non-uniform age weights and 3% discounting, a death in infancy corresponds to 33 YLL, and deaths at ages 5–20 to around 36 YLL.

Source: Mortality and Burden of Disease Estimates for WHO Member States in 2004. Geneva, WHO, 2009.

Available at: www.who.int/entity/healthinfo/statistics/bodgbddeathdalyestimates.xls. Communicable diseases include maternal causes, conditions arising during the perinatal period and nutritional deficiencies. Income-group aggregates are based on the 2004 World Bank list of economies. Individual percentages may not add up to 100% owing to rounding

8. The disability-adjusted life-year (DALY)

Rationale for use: DALY is a health gap measure that extends the concept of potential years of life lost due to premature death (PYLL) to include equivalent years of 'healthy' life lost by virtue of being in states of poor health or disability. DALYs for a disease or health condition are calculated as the sum of the years of life lost due to premature mortality (YLL) in the population and the years lost due to disability (YLD) for incident cases of the health condition.

Methods of estimation: Life tables specifying all-cause mortality rates by age and sex for 192 WHO Member States were developed for 2002 from available death registration data, sample registration systems (India and China) and data on child and adult mortality from censuses and surveys. Cause-of-death distributions were estimated from death registration data for 107 countries, together with data from population-based epidemiological studies, disease registers and notification systems for selected specific causes of death. Causes of death for populations without useable death registration data were estimated using cause-of-death models together with data from population-based epidemiological studies, disease registers and notification systems for 21 specific causes of death.

9. Causes of death among children under 5 years of age (%)

Rationale for use: MDG4 consists in the reduction of under-5 mortality by two-thirds in 2015, from its level in 1990. Child survival efforts can be effective only if they are based on reasonably accurate information about the causes of childhood deaths.

Cause-of-death information is needed to prioritize interventions and plan for their delivery, to determine the effectiveness of disease-specific interventions, and to assess trends in disease burden in relation to national and international goals.

Definition: The cause(s) of death (CoD) as entered on the medical certificate of cause of death in countries with civil (vital) registration system. The underlying CoD is being analysed. In countries with incomplete or no civil registration, causes of death are those reported as such in epidemiological studies that use verbal autopsy algorithms to establish CoD.

Methods of estimation: CoD data from civil registration systems were evaluated for their completeness. Complete and nationally representative data were then grouped by ICD codes into the cause categories, and their proportions to total under-5 deaths were then computed. For countries with incomplete or no data, the distribution of deaths by cause was estimated in two steps. In the first step, a statistical model was used to assign deaths to one of three broad categories of causes: communicable diseases; non-communicable diseases; or injuries and external causes.

In a second step, cause-specific under-5 mortality estimates from the Child Health Epidemiology Reference Group (CHERG), WHO Technical Programmes and the Joint United Nations Programme on HIV/AIDS (UNAIDS) were taken into account in assigning the distribution of deaths to specific causes. A variety of methods, including proportional mortality and natural history models, were used by CHERG and WHO to develop country-level cause-specific mortality estimates. All CHERG working groups developed comparable and standardized procedures to generate estimates from the databases.

Source: Mortality Data. Geneva, WHO, 2010. Available at: www.who.int/healthinfo/statistics/mortality/en/.

The health system

Health system outcomes

10. Family planning needs satisfied (%)

Definition : Proportion of all women aged 15-49 using contraception among those who are fecund, in union and in need of contraception. Women in need of contraception include those that do not want any more children or that want to wait two or more years before having another child.

Numerator: Number of women aged 15-49 that are fecund and are married / have a partner and need contraception, who use any kind of contraceptive (modern or traditional).

Denominator: Total number of women aged 15-49 that are fecund and are married / have a partner and need contraception.

Method of estimation : Data are derived from re-analysis of Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS) micro-data which are publicly available using the standard indicator definitions as published in DHS or Unicef documentation. The analysis was done by the International Center for Analysis and Monitoring of Equity in Health and Nutrition based in the Federal University of Pelotas, Brazil.

11. Neonates protected at birth against neonatal tetanus (PAB) (%)

Rationale for use: Immunization is an essential component for reducing under-five mortality. Immunization coverage estimates are used to monitor coverage of immunization services and to guide disease eradication and elimination efforts.

Definition: The proportion of neonates in a given year that can be considered as having been protected against tetanus as a result of maternal immunization.

Method of estimation: PAB coverage is estimated using a mathematical model. PAB is the proportion of births in a given year that can be considered as having been protected against tetanus as a result of maternal immunization.

Source: UNICEF and WHO; WHO Global Health Observatory Data Repository. Data extracted on 2013-06-12 14:57:27.0. <http://apps.who.int/gho/data/node.main.A824?lang=en>

Health financing system

12. Total expenditure on health as percentage of gross domestic product (GDP)

13. Per capita total expenditure on health at international dollar rate

14. General government expenditure on health as percentage of total general government expenditure

Rationale for use: Health financing is a critical component of health systems. National health accounts (NHAs) provide a large set of indicators based on the expenditure information collected within an internationally recognized framework. NHAs are a synthesis of the financing and spending flows recorded in the operation of a health system, from funding sources to the distribution of funds across providers and functions of health systems and benefits across geographic, demographic, socioeconomic and epidemiological dimensions.

Definitions:

- Total health expenditure as percentage of GDP
- Percentage of total general government expenditure that is spent on health
- Per capita total expenditure on health at international dollar rate

Methods of estimation: Only about 95 countries either have produced a full NHA or report expenditure on health to the Organisation for Economic Cooperation and Development (OECD). Standard accounting estimation and extrapolation techniques have been used to provide time series. The principal international references used are the International Monetary Fund (IMF) Government Finance Statistics and International Financial Statistics; OECD Health Data and International

Development Statistics; and the United Nations National Accounts Statistics. National sources include national health accounts reports, public expenditure reports, statistical yearbooks and other periodicals, budgetary documents, national accounts reports, statistical data on official websites, central bank reports, non-governmental organization reports, academic studies, and reports and data provided by central statistical offices and ministries.

Source: WHO National Health Accounts (NHA), Country Health Expenditure Database. Geneva: WHO, February 2010. Available at: www.who.int/nha/country/. The regional, income and global figures are calculated using Purchasing Power Parity (PPP) terms. When the number is smaller than 0.05%, the percentage may appear as zero. For per capita expenditure indicators, this is represented as <1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2008 data will cover the fiscal year 2007–08). Absolute values of expenditures are expressed in nominal terms (current prices). National currency units per US\$ are calculated using the average exchange rates for the year. For 2008, the use of yearly average exchange rates (compared with year-end exchange rates) may not fully represent the impact of the global financial crisis.

15. **General government expenditure on health as percentage of total expenditure on health**
16. **General government expenditure on health as percentage of total government expenditure**
17. **External resources for health as percentage of total expenditure on health**
18. **Out-of-pocket expenditure as percentage of private expenditure on health**
19. **Per capita total expenditure on health at average exchange rate (US\$)**
20. **Per capita government expenditure on health at average exchange rate (US\$)**
21. **Per capita government expenditure on health at international dollar rate**

Rationale for use: Health financing is a critical component of health systems. NHAs provide a large set of indicators based on the expenditure information collected within an internationally recognized framework. NHAs are a synthesis of the financing and spending flows recorded in the operation of a health system, from funding sources to the distribution of funds across providers and functions of health systems and benefits across geographic, demographic, socioeconomic and epidemiological dimensions.

Definitions: Key indicators for which the data are available:

- Level of total expenditure on health as percentage of GDP, and per capita health expenditures in US dollars and in international dollars.

- Distribution of public and private sectors in financing health and their main components, such as:

*Extent of social and private health insurance

*Burden on households through out-of-pocket spending

*Reliance on external resources in financing health

Associated terms:

-Gross domestic product (GDP) is the value of all goods and services provided in a country by residents and non-residents. This corresponds to the total sum of expenditure (consumption and investment) of the private and government agents of the economy during the reference year.

-General government expenditure (GGE) includes consolidated direct outlays and indirect outlays, such as subsidies and transfers, including capital, of all levels of government social security institutions, autonomous bodies, and other extrabudgetary funds.

-Total expenditure on health (THE) is the sum of general government health expenditure and private health expenditure in a given year, calculated in national currency units in current prices. It comprises the outlays earmarked for health maintenance or for restoration or enhancement of the health status of the population, paid for in cash or in kind.

-General government expenditure on health (GGHE) is the sum of outlays by government entities to purchase health care services and goods. It comprises the outlays on health by all levels of government and by social security agencies, and direct expenditure by parastatals and public firms. Expenditures on health include final consumption, subsidies to producers and transfers to households(chiefly reimbursements for medical and pharmaceutical bills). It includes both recurrent and investment expenditures (including capital transfers) made during the year. Besides domestic funds, it also includes external resources (mainly as grants passing through the government or loans channelled through the national budget).

-Social security expenditure on health (SSHE) includes outlays for purchases of health goods and services by schemes that are mandatory and controlled by government. Such social security schemes that apply only to a selected group of the population, such as public sector employees only, are also included here.

-External resources health expenditure (ExtHE) includes all grants and loans, whether passing through governments or private entities for health goods and services, in cash or in kind.

- Private health expenditure (PvtHE) is defined as the sum of expenditures on health by the following entities:

*Prepaid plans and risk-pooling arrangements (PrepaidHE) are the outlays of private insurance schemes and private social insurance schemes (with no government control over payment rates and participating providers, but with broad guidelines from government)

*Firms expenditure on health are the outlays by private enterprises for medical care and health-enhancing benefits other than payment to social security or other prepaid schemes.

*Non-profit institutions serving mainly households are the outlays of those entities whose status do not permit them to be a source of financial gain for the units that establish, control or finance them. This includes funding from internal and external sources.

*Household out-of-pocket spending (OOPS) comprises the direct outlays of households, including gratuities and in-kind payments made to health practitioners and to suppliers of pharmaceuticals, therapeutic appliances, and other goods and services. This includes household direct payments to public and private providers of health care services, nonprofit institutions, and non-reimbursable cost sharing, such as deductibles, copayments and fee for services.

- Exchange rate is the annual average or year-end number of units at which a currency is traded in the banking system.

- International dollars are derived by dividing local currency units by an estimate of their Purchasing Power Parity (PPP) compared with the US dollar, i.e. the measure that minimizes the consequences of differences in price levels between countries.

Methods of estimation and sources: About 100 countries either have produced full national health accounts or report expenditure on health to the OECD. Standard accounting estimation and extrapolation techniques have been used to provide time series (1998–2004). Ministries of Health have responded to the draft updates sent for their inputs and comments. For details on sources and methods, see www.who.int/nha.

Service delivery

22. Treatment success rate for new pulmonary smear-negative and extrapulmonary tuberculosis cases

Rationale for use : Treatment success is an indicator of the performance of national TB control programmes. In addition to the obvious benefit to individual patients, successful treatment of infectious cases of TB is essential to prevent the spread of the infection. Detecting and successfully treating a large proportion of TB cases should have an immediate impact on TB prevalence and mortality. By reducing transmission, successfully treating the majority of cases will also affect, with some delay, the incidence of disease.

Definition : The proportion of new smear-negative and extrapulmonary (or smear unknown/not done) TB cases registered under a national TB control programme in a given year that successfully completed treatment (without bacteriological evidence of success, ie “treatment completed”).

At the end of treatment, each patient is assigned one of the following five mutually exclusive treatment outcomes: completed; died; failed; defaulted; and transferred out with outcome unknown. The proportions of cases assigned to these outcomes, plus any additional cases registered for treatment but not assigned to an outcome, add up to 100% of cases registered.

Method of measurement : Treatment success rates are calculated from cohort data (outcomes in registered patients) as the proportion of new smear-negative and extrapulmonary TB cases registered under a national TB control programme in a given year that successfully completed treatment without bacteriologic evidence of success. The treatment outcomes of TB cases registered for treatment are reported annually by countries to WHO using a web-based data collection system. See the WHO global tuberculosis control report. The treatment outcomes of TB cases reported by countries follow the WHO recommendations on definitions of outcomes, they are internationally comparable and there is no need for any adjustment.

Because treatment for TB lasts 6–8 months, there is a delay in assessing treatment outcomes. Each year, national TB control programmes report to WHO the number of cases of TB diagnosed in the preceding year, and the outcomes of treatment for the cohort of patients who started treatment a year earlier.

23. Treatment success rate for retreatment tuberculosis cases

Rationale for use : Treatment success is an indicator of the performance of national TB control programmes. In addition to the obvious benefit to individual patients, successful treatment of infectious cases of TB is essential to prevent the spread of the infection. Detecting and successfully treating a large proportion of TB cases should have an immediate impact on TB prevalence and mortality. By reducing transmission, successfully treating the majority of cases will also affect, with some delay, the incidence of disease.

Definition : The proportion of cases with previous TB treatment history registered under a national TB control programme in a given year that successfully completed treatment, whether with or without bacteriological evidence of success (“cured” or “treatment completed” respectively). At the end of treatment, each patient is assigned one of the following six mutually exclusive treatment outcomes: cured; completed; died; failed; defaulted; and transferred out with outcome unknown. The proportions of cases assigned to these outcomes, plus any additional cases registered for treatment but not assigned to an outcome, add up to 100% of cases registered.

Method of measurement : Treatment success rates are calculated from cohort data (outcomes in registered patients) as the proportion of cases with previous TB treatment history registered under a national TB control programme in a given year that successfully completed treatment, whether with (“cured”) or without (“treatment completed”) bacteriologic evidence of success. The treatment outcomes of TB cases registered for treatment are reported annually by countries to WHO using a web-based data collection system. See the WHO global tuberculosis control report. The treatment outcomes of TB cases reported by countries follow the WHO recommendations on definitions of outcomes, they are internationally comparable and there is no need for any adjustment. Because treatment for TB lasts 6–8 months, there is a delay in assessing treatment outcomes. Each year, national TB control programmes report to WHO the number of cases of TB diagnosed in the preceding year, and the outcomes of treatment for the cohort of patients who started treatment a year earlier.

Health workforce

24. Number of:

- physicians per 10000 population
- nurses per 10000 population
- midwives per 10000 population

Rationale for use: The availability and composition of human resources for health is an important indicator of the strength of the health system. Even though there is no consensus about the optimal level of health workers for a population, there is ample evidence that worker numbers and quality are positively associated with immunization coverage, outreach of primary care, and infant, child and maternal survival.

Definitions:

- Physicians: includes generalists and specialists.
- Nurses: includes professional nurses, auxiliary nurses, enrolled nurses and other nurses, such as dental nurses and primary care nurses.
- Midwives: includes professional midwives, auxiliary midwives and enrolled midwives. Traditional birth attendants, who are counted as community health workers, appear elsewhere.
- Dentists: includes dentists, dental assistants and dental technicians.
- Pharmacists: includes pharmacists, pharmaceutical assistants and pharmaceutical technicians.
- Public and environmental health workers: includes environmental and public health officers, sanitarians, hygienists, public and environmental health technicians, district health officers, malaria technicians, meat inspectors, public health supervisors, and similar professions.
- Community health workers: includes traditional medicine practitioners, faith healers, assistant/community health education workers, community health officers, family health workers, lady health visitors, health extension package workers, community midwives, institution-based personal care workers and traditional birth attendants.
- Laboratory health workers: includes laboratory scientists, laboratory assistants, laboratory technicians and radiographers.
- Other health workers: includes a large number of occupations such as dieticians and nutritionists, medical assistants, occupational therapists, operators of medical and dentistry equipment, optometrists and opticians, physiotherapists, podiatrists, prosthetic/orthotic engineers, psychologists, respiratory therapists, speech pathologists, and medical trainees and interns.
- Health management and support workers: includes general managers, statisticians, lawyers, accountants, medical secretaries, gardeners, computer technicians, ambulance staff, cleaning staff, building and engineering staff, skilled administrative staff, and general support staff.

Methods of estimation: No methods of estimation have been developed.

Source: WHO Global Atlas of the Health Workforce. Geneva: WHO, 2009.

Available at: <http://apps.who.int/globalatlas/default.asp>. See this source for the latest updates, time-trend statistics and disaggregated data, as well as metadata descriptors. In general, the denominator data for health workforce density (i.e. national population estimates) were obtained from the World Population Prospects Database of the United Nations Population Division. In some cases, official reports provided only workforce density indicators, from which estimates of the absolute numbers were calculated. Depending on the organization of national health systems and means of monitoring, data may not be exactly comparable across countries. Data from the years prior to 2000 were excluded from this edition.

25. Density of environment and public health workers (per 10 000 population)

Rationale for use : Preparing the health workforce to work towards the attainment of a country's health objectives represents one of the most important challenges for its health system. Measuring and monitoring the availability of health workers is a critical starting point for understanding the health system resources situation in a country. While there are no gold standards for assessing the sufficiency of the health workforce to address the health care needs of a given population, low density of health personnel usually suggests inadequate capacity to meet minimum coverage of essential services.

Definition : Number of environment and public health workers per 10 000 population.

Method of measurement

The method of estimation for number of environment and public health workers (including environmental and public health officers, environmental and public health technicians, sanitarians, hygienists and related occupations) depends on the nature of the original data source. Enumeration based on population census data is a count of the number of people reporting their current occupation in dentistry (as classified according to the tasks and duties of their job). A similar method is used for estimates based on labour force survey data, with the additional application of a sampling weight to calibrate for national representation. Data from health facility assessments and administrative reporting systems may be based on head counts of employees, duty rosters, staffing records, payroll records, registries of health professional regulatory bodies, or tallies from other types of routine administrative records on human resources. Ideally, information on the stock of health workers should be assessed through administrative records compiled, updated and reported at least annually, and periodically validated and adjusted against data from a population census or other nationally representative source.

Method of estimation : WHO compiles data on health workforce from four major sources: population censuses, labour force and employment surveys, health facility assessments and routine administrative information systems (including reports on public expenditure, staffing and payroll as well as professional training, registration and licensure). Most of the data from administrative sources are derived from published national health sector reviews and/or official country reports to WHO offices. In general, the denominator data for workforce density (i.e. national population estimates) are obtained from the United Nations Population Division's World Population Prospects database

26. Density of community health workers (per 10 000 population)

Rationale for use : Preparing the health workforce to work towards the attainment of a country's health objectives represents one of the most important challenges for its health system. Measuring and monitoring the availability of health workers is a critical starting point for understanding the health system resources situation in a country. While there are no gold standards for assessing the sufficiency of the health workforce to address the health care needs of a given population, low density of health personnel usually suggests inadequate capacity to meet minimum coverage of essential services. In particular, many countries, especially ones with shortages and maldistribution of highly skilled medical and nursing professionals, rely on community health workers – community health aides selected, trained and working in the communities from which they come – to render certain basic health services.

Definition : Number of community health workers per 10 000 population.

Method of measurement : The method of estimation for number of community health workers (including community health officers, community health-education workers, community health aides, family health workers and associated occupations) depends on the nature of the original data source. Enumeration based on population census data is a count of the number of people reporting 'community health worker' as their current occupation (as classified according to the tasks and duties of their job). A similar method is used for estimates based on labour force survey data, with the additional application of a sampling weight to calibrate for national representation. Data from health facility assessments and administrative reporting systems may be based on head counts of employees, staffing records, payroll records, training records, or tallies from other types of routine administrative records on human resources. Ideally, information on the stock of health workers should be assessed through administrative records compiled, updated and reported at least annually, and periodically validated and adjusted against data from a population census or other nationally representative source.

Method of estimation : WHO compiles data on health workforce from four major sources: population censuses, labour force and employment surveys, health facility assessments and routine administrative information systems (including reports on public expenditure, staffing and payroll as well as professional training, registration and licensure). Most of the data from administrative sources are derived from published national health sector reviews and/or official country reports to WHO offices. In general, the denominator data for workforce density (i.e. national population estimates) are obtained from the United Nations Population Division's World Population Prospects database.

27. Density of other health service providers (per 10 000 population)

Rationale for use : Preparing the health workforce to work towards the attainment of a country's health objectives represents one of the most important challenges for its health system. Measuring and monitoring the availability of health workers is a critical starting point for understanding the health system resources situation in a country. While there are no gold standards for assessing the sufficiency of the health workforce to address the health care needs of a given population, low density of health personnel usually suggests inadequate capacity to meet minimum coverage of essential services.

Definition : Number of other health service providers (excepting physicians, nursing and midwifery personnel, dentistry personnel and community health workers) per 10 000 population.

Method of measurement : The method of estimation for numbers of other health service providers (which may include a large range of occupations such as ambulance workers, dieticians and nutritionists, environmental and occupational health inspectors, medical assistants, medical imaging technicians, medical laboratory technicians, optometrists, paramedical practitioners, personal care workers, pharmaceutical personnel, physiotherapists, speech therapists, and traditional and complementary medicine practitioners) depends on the organization of the national health system and the nature of the original data source. Enumeration based on population census data is a count of the number of people reporting a health occupation (as classified according to the tasks and duties of their job). A similar method is used for estimates based on labour force survey data, with the additional application of a sampling weight to calibrate for national representation. Data from health facility assessments and administrative reporting systems may be based on head counts of employees, duty rosters, staffing records, payroll records, registries of health professional regulatory bodies, or tallies from other types of routine administrative records on human resources. Ideally, information on the stock of health workers should be assessed through administrative records compiled, updated and reported at least annually, and periodically validated and adjusted against data from a population census or other nationally representative source.

Method of estimation : WHO compiles data on health workforce from four major sources: population censuses, labour force and employment surveys, health facility assessments and routine administrative information systems (including reports on public expenditure, staffing and payroll as well as professional training, registration and licensure). Most of the data from administrative sources are derived from published national health sector reviews and/or official country reports to WHO offices. In general, the denominator data for workforce density (i.e. national population estimates) are obtained from the United Nations Population Division's World Population Prospects database.

Medical products, vaccines, infrastructures and equipment**28. Hospital beds per 10 000 population**

Rationale for use: Service delivery is an important component of health systems. To capture availability access and distribution of health services delivery, a range of indicators or a composite indicator is needed. Currently, there are no such data for the majority of countries. Inpatient bed density is one of the few available indicators on a component of level of health service delivery.

Definition: Number of inpatient beds per 10 000 population.

Methods of estimation: Empirical data only, with possible adjustment for underreporting (e.g. missing private facilities). Additional data are compiled by the WHO Regional Office for Africa.

29. Density of mammographs (per million females aged between 50 and 69 years old)

Definition : Number of mammographs units from the public and private sectors, per million population of females aged between 50 and 69 years old.

Method of measurement : Count of medical devices available in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The females population data was obtained from the United Nations Statistics Division (UNSD). In the case UNSD females population data was not available we have used the population data estimates from the population prospects of the CIA World Factbook 2011. Predominant type of statistics: Unadjusted.

30. Density of computed tomography units (per million population)

Definition : Computed tomography (CT) scan units from the public and private sectors, per 1 000 000 population.

Method of measurement : Count of medical devices available in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

31. Density of magnetic resonance imaging units (per million population)

Definition : Number of Magnetic Resonance units from the public and private sectors, per 1 000 000 population.

Method of measurement : Count of medical devices available in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

32. Density of linear accelerator units (per million population)

Definition : Number of linear accelerators units from the public and private sectors, per 1 000 000 population.

Method of measurement : Count of medical devices available in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. In case of non-response, Directory of Radiotherapy Centres (DIRAC) International Atomic Energy Agency data was used. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

33. Density of gamma camera or nuclear medicine units (per million population)

Definition : Nuclear medicine units from the public and private sectors, per 1 000 000 population.

Method of measurement : Count of medical devices available in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

34. Density of health posts (per 100 000 population)

Definition

Number of health posts from the public and private sectors, per 100,000 population. Health posts are either community centres or health environments with a very limited number of beds with limited curative and preventive care resources normally assisted by health workers or nurses.

Method of measurement

Count of health posts available in the country, divided by the number of population.

Method of estimation

Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

35. Density of provincial hospitals (per 100 000 population)

Definition : Number of provincial hospitals from the public and private sectors, per 100,000 population.

Method of measurement : Count of provincial hospitals available in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

36. Density of health centres (per 100 000 population)

Definition : Number of health centres from the public and private sectors, per 100,000 population.

Method of measurement : Count of health centres available in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

37. Density of district/rural hospitals (per 100 000 population)

Definition : Number of district/rural hospitals from the public and private sectors, per 100,000 population.

Method of measurement : Count of district/rural hospitals in the country, divided by the number of population.

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. The population data was obtained from the United Nations Statistics Division. Predominant type of statistics: Unadjusted.

38. Unit in the Ministry of Health responsible for the management of medical devices

Definition : Identification of a unit within the MoH that can perform Health Technology

Assessment, planning, acquisition, utilization or other type of medical devices management related tasks. The existence of this unit was noted as "Yes", the non-existence as "No".

Method of measurement : Verify the existence of a Unit within the country MoH responsible for the management of medical devices

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. Predominant type of statistics: Unadjusted.

39. Availability of national standards or recommended lists of medical devices

Definition : National recommended lists or national standards that help define the medical devices required for specific clinical procedures. They, therefore, assist in increasing the availability of the medical devices when required. The following four categories were taken into account: 1: For different healthcare facilities; 2: For specific procedures; 3: For different healthcare facilities and specific procedures; 4: No list available

Method of measurement : Count the existence of each of the medical devices lists types available in the country

Method of estimation : Information collected directly from ministries of health through the baseline country survey on medical devices 2010, conducted by HQ/HSS/EHT/DIM. Predominant type of statistics: Unadjusted.

Health Information - Civil Registration Coverage

40. Coverage of vital registration of deaths

Rationale for use: Health information is an essential component of health systems. The registration of births and deaths with causes of death, called 'civil registration (vital registration)', is an important component of a country's health information system.

Definition: Percentage of estimated total deaths that are 'counted' through a civil registration system.

Methods of estimation: Expected numbers of deaths by age and sex are estimated from current life tables, based on multiple sources. Reported numbers are compared with expected numbers by age and sex to obtain an estimate of coverage of the vital registration system.

Sources: (i) **United Nations Demographic Yearbook 2007.** New York: United Nations Statistics Division, 2009.

Available at: <http://unstats.un.org/unsd/demographic/products/dyb/dybssets/2007%20DYB.pdf>; (ii) WHO Mortality Database: Tables. Geneva: WHO, 2009. Available at: www.who.int/healthinfo/morttables.

Specific programmes and services

HIV/AIDS

41. Prevalence of HIV among adults aged 15 to 49 years (%) of age

Rationale for use: HIV/AIDS has become a major public health problem in many countries, and monitoring the course of the epidemic and the impact of interventions is crucial. Both the MDGs and the United Nations General Assembly Special Session on HIV and AIDS (UNGAS) have set goals for reducing HIV prevalence.

Definition: Percentage of people with HIV infection among all people aged 15–49 years.

Methods of estimation: HIV prevalence data from HIV sentinel surveillance systems, which may include national population surveys with HIV testing, are used to estimate HIV prevalence using standardized tools and methods of estimation developed by UNAIDS and WHO in collaboration with the UNAIDS Reference Group on Estimation, Modelling and Projections. Tools for estimating the level of HIV infection are different for generalized epidemics, and concentrated or low-level epidemics.

42. People with advanced HIV infection receiving antiretroviral (ARV) combination therapy (%)

Rationale for use: As the HIV epidemic matures, increasing numbers of people are reaching advanced stages of HIV infection. ARV combination therapy has been shown to reduce mortality among those infected, and efforts are being made to make it more affordable even in less-developed countries. This indicator assesses the progress in providing ARV combination therapy to everyone with advanced HIV infection.

Definition: Percentage of people with advanced HIV infection receiving ARV therapy according to nationally approved treatment protocol (or WHO/Joint UN Programme on HIV and AIDS standards) among the estimated number of people with advanced HIV infection.

Methods of estimation: The denominator of the coverage estimate is obtained from models that also generate the HIV prevalence, incidence and mortality estimates. The number of adults with advanced HIV infection who need to start treatment is estimated as the number of AIDS cases in the current year times 2. The total number of adults needing ARV therapy is calculated by adding the number of adults who need to start ARV therapy to the number of adults who are being treated in the previous year and have survived into the current year.

Source: Towards Universal Access: Scaling Up Priority HIV/AIDS Interventions in The Health Sector: Progress Report, 2008. Geneva: WHO, Joint United Nations Programme on HIV/AIDS, United Nations Children's Fund, 2008. WHO regional and global figures are updates for the year 2008. Income-group aggregates are based on the World Bank 2008 list of economies.

43. Prevalence of condom use by adults aged 15-49 years (%) during higher-risk sex

Rationale for use: Consistent correct use of condoms within non-regular sexual partnerships substantially reduces the risk of sexual HIV transmission.

Definition: Percentage of people aged 15-49 years reporting the use of a condom during the last sexual intercourse with a non-regular partner among those who had sex with a non-regular partner in the last 12 months.

Methods of estimation: Empirical data only. Survey respondents aged 15-49 years are asked whether they have commenced sexual activity. Those who report sexual activity and have had sexual intercourse with a non-regular partner in the last 12 months are further asked about the number of non-regular partners and condom use the last time they had sex with a nonregular partner.

Source: Data are from Demographic and Health Surveys (DHS) and exclude country-reported data. 2008 Report on the Global AIDS Epidemic. Geneva: Joint United Nations Programme on HIV/AIDS, WHO, 2008.

Available at: www.unaids.org/en/KnowledgeCentre/HIVData/GlobalReport/2008/2008_Global_report.asp. See Annex 2: Country Progress Indicators.

Tuberculosis

44. Incidence of tuberculosis

Rationale for use: Incidence (cases arising in a given time period) gives an indication of the burden of TB in a population, and of the size of the task faced by a national TB control programme. Incidence can change as the result of changes in transmission (the rate at which people become infected with *Mycobacterium tuberculosis*, the bacterium that causes TB) or changes in the rate at which people infected with *M. tuberculosis* develop TB disease (e.g. as a result of changes in nutritional status or of HIV infection). Because TB can develop in people who became infected many years previously, the effect of TB control on incidence is less immediate than the effect on prevalence or mortality. MDG6, Target 8 is 'to have halted by 2015 and begun to reverse the incidence of TB. WHO estimates that in 2004 the per capita incidence of TB was stable or falling in 5 out of 6 WHO Regions, but growing globally at 0.6% per year. The exception was the African Region, where incidence is apparently still increasing, but less rapidly each year. Implementation of the Stop TB Strategy, following the Global Plan to Stop TB 2006-2015, is expected to reverse the rise in incidence globally by 2015.

Definition: Estimated number of TB cases arising in a given time period (expressed as per capita rate). All forms of TB are included, as are cases in people with HIV.

Methods of estimation: Estimates of TB incidence, prevalence and mortality are based on a consultative and analytical process in WHO and are published annually. Estimates of incidence for each country are derived using one or more of four approaches, depending on the available data:

incidence = case notifications/proportion of cases detected

incidence = prevalence/duration of condition

incidence = annual risk of TB infection × Styblo coefficient

incidence = deaths/proportion of incident cases that die

Data are for all forms of tuberculosis, including tuberculosis in people with HIV infection.

Source: Global Tuberculosis Control: A Short Update to the 2009 Report. Geneva: WHO, 2009 (WHO/HTM/TB/2009.426).

Available at: www.who.int/tb/publications/global_report. WHO region, income group and global aggregates include territories.

45. Prevalence of tuberculosis

Rationale for use: Prevalence and mortality are direct indicators of the burden of TB, indicating the number of people suffering from the disease at a given point in time and the number dying each year. Furthermore, prevalence and mortality respond quickly to improvements in control, as timely and effective treatments reduce the average duration of disease (thus decreasing prevalence) and the likelihood of dying from the disease (thus reducing disease-specific mortality). MDG6 is 'to combat HIV/AIDS, malaria and other diseases' (including TB). This goal is linked to Target 8, 'to have halted by 2015 and begun to reverse the incidence of malaria and other major diseases', and MDG Indicator 24, 'prevalence and mortality rates associated with TB'. The Stop TB Partnership has endorsed the related targets of reducing per capita TB prevalence and mortality by 50% relative to 1990, by the year 2015. There are few good data with which to establish TB prevalence and mortality, particularly for the baseline year of 1990. However, current best estimates suggest that implementation of the Global Plan to Stop TB 2006-2015 will halve 1990 prevalence and mortality rates globally and in most regions by 2015, though not in Africa and Eastern Europe.

Definition: The number of cases of TB (all forms) in a population at a given point in time (sometimes referred to as 'point prevalence') expressed in this database as number of cases per 100 000 population.

Methods of estimation: Estimates of TB incidence, prevalence and mortality are based on a consultative and analytical process in WHO and are published annually. The methods used to estimate TB prevalence and mortality rates are described in detail elsewhere. Country-specific estimates of prevalence are, in most instances, derived from estimates of incidence, combined with assumptions about the duration of disease. The duration of disease is assumed to vary according to whether the disease is smear-positive or not; whether the individual receives treatment in a DOTS programme or non-DOTS programmes, or is not treated at all; and whether the individual is infected with HIV.

46. Tuberculosis: DOTS case detection rate

Rationale for use: The proportion of estimated new smear-positive cases that are detected (diagnosed and notified to WHO) by DOTS programmes provides an indication of how effective national TB programmes are in finding people with TB and diagnosing the disease.

Methods of estimation: Estimates of incidence are based on a consultative and analytical process in WHO, and are published annually. The DOTS detection rate for new smear-positive cases is calculated by dividing the number of new smear-positive cases notified to WHO by the estimated number of incident smear-positive cases for the same year.

47. Tuberculosis mortality

Rationale for use: Prevalence and mortality are direct indicators of the burden of tuberculosis (TB), indicating the number of people suffering from the disease at a given point in time and the number dying each year. Furthermore, prevalence and mortality respond quickly to improvements in control, as timely and effective treatment reduces the average duration of disease (thus decreasing prevalence) and the likelihood of dying from the disease (thus reducing disease-specific mortality).

Definition: Estimated number of deaths due to TB in a given time period. It is expressed in this database as deaths per 100 000 population per year. Includes deaths from all forms of TB, and deaths from TB in people with HIV.

Methods of estimation: Estimates of TB incidence, prevalence and mortality are based on a consultative and analytical process in WHO and are published annually. The methods used to estimate TB mortality rates are described in detail elsewhere. Country-specific estimates of TB mortality are, in most instances, derived from estimates of incidence, combined with assumptions about the case fatality rate. The case fatality rate is assumed to vary according to whether the disease is smear-positive or not; whether the individual receives treatment in a DOTS programme or non-DOTS programmes, or is not treated at all; and whether the individual is infected with HIV. These are classified as deaths from tuberculosis according to the International Statistical Classification of Diseases and Related Health Problems, 10th revision. Geneva, WHO, 1992.

Source: Global Tuberculosis Control: A Short Update to the 2009 Report. Geneva, WHO, 2009 (WHO/HTM/TB/2009.426). Available at: www.who.int/tb/publications/global_report. WHO Regional, income group and global aggregates include territories.

Malaria

48. Children under 5 years of age sleeping under insecticide-treated bed nets (%)

Rationale for use: In areas of intense malaria transmission, malaria-related morbidity and mortality are concentrated in young children, and the use of insecticide-treated nets (ITNs) by children under 5 years of age has been demonstrated to considerably reduce malaria disease incidence, malaria-related anaemia and all-cause under-5 mortality. Vector control through the use of ITNs constitutes one of the four intervention strategies of the Roll Back Malaria Initiative. It is also listed as an MDG indicator.

Definition: Percentage of children under 5 years of age in malaria-endemic areas who slept under an ITN the previous night, ITN being defined as a mosquito net that has been treated within 12 months or is a long-lasting insecticidal net (LLIN).

Methods of estimation: Empirical data only.

Source: World Malaria Report 2009, Annex 6. Geneva: WHO, 2009.

Available at: www.who.int/malaria/world_malaria_report_2009/mal2009_annex6_0010.pdf.

49. Children under 5 years of age with fever being treated with antimalarial drugs (%)

Rationale for use: Prompt treatment with effective antimalaria drugs for children with fever in malaria risk areas is a key intervention to reduce mortality. In addition to being listed as a global MDG indicator under Goal 6, effective malaria treatment is

also identified by WHO, UNICEF and the World Bank as one of the four main interventions to reduce the burden of malaria in Africa: (i) use of insecticide treated nets (ITNs); (ii) prompt access to effective treatments in or near the home, (iii) provision of antimalaria drugs to symptom-free pregnant women in stable transmission areas; and (iv) improved forecasting, prevention and response, essential to respond quickly and effectively to malaria epidemics. In areas of sub-Saharan Africa with stable levels of malaria transmission, it is essential that access to prompt treatment be ensured. This requires drug availability at household or community level and, for complicated cases, availability of transport to the nearest equipped facility. Reserve drug stocks, transport and hospital capacity are needed to mount an appropriate response to malaria cases and prevent the onset of malaria from degenerating to a highly lethal complicated malaria picture.

Definition: Percentage of population under 5 years of age in malaria-risk areas with fever being treated with effective antimalaria drugs.

Methods of estimation: For prevention, the indicator is calculated as the percentage of children under 5 years of age who received effective antimalaria drugs upon a fever episode. The information is obtained directly from household surveys. The empirical values are directly reported without further estimation.

Immunization, vaccines and emergencies

50. One-year-olds immunized with:

- **one dose of Baccille Calmette Guerin vaccine (BCG)**
- **protection at birth (PAB)**
- **three doses of polio vaccine (Pol3)**
- **one dose of measles-containing vaccine (MCV)**
- **three doses of Haemophilus influenzae type B vaccine (Hib3)**
- **three doses of diphtheria toxoid, tetanus toxoid and pertussis vaccine (DTP3)**
- **three doses of hepatitis B vaccine (HepB3)(%)**
- **three doses of pneumococcal conjugate vaccine (PCV)**

Rationale for use: Immunization coverage estimates are used to monitor immunization services and to guide disease eradication and elimination efforts, and are a good indicator of health systems performance.

Definition: BCG immunization coverage is the percentage of one-year-olds who have received at least one dose of Bacilli Calmette Guerin vaccine in a given year. Pol3 immunization coverage is the percentage of one-year-olds who have received three doses of poliomyelitis vaccine in a given year. Measles immunization coverage is the percentage of 1-year-olds who have received at least one dose of measles containing vaccine in a given year. For countries recommending the first dose of measles among children older than 12 months of age, the indicator is calculated as the proportion of children less than 24 months of age receiving one dose of measles containing vaccine. Hib3 immunization coverage is the percentage of one-year-olds who have received three doses of Haemophilus influenzae type B vaccine in a given year. DTP3 immunization coverage is the percentage of 1-year-olds who have received three doses of the combined diphtheria and tetanus toxoid and pertussis vaccine in a given year. HepB3 immunization coverage is the percentage of 1-year-olds who have received three doses of Hepatitis B3 vaccine in a given year. PCV immunization coverage is the percentage of one-year-olds who have received at least one dose of pneumococcal conjugate vaccine in a given year.

Methods of estimation: WHO and UNICEF rely on reports from countries, household surveys and other sources such as research studies. Both organizations have developed common review process and estimation methodologies. Draft estimates are made, reviewed by country and external experts and then finalized.

Sources: Unless otherwise stated, data are derived from Demographic and Health Surveys (DHS) conducted since 2000. The DHS figures were extracted using STATcompiler software (www.measuredhs.com/). When not available using STATcompiler software, figures were extracted directly from DHS reports. For some countries and some of the indicators, there were differences in the figures extracted from the country reports and STATcompiler. In these cases, following discussions with staff from the MEASURE DHS implementation group (ICF Macro), data from the country reports were used. Further information regarding the source of individual country data can be obtained on request from WHO.

Child and adolescent health

51. Distribution of causes of death among children aged <5 years (%)

Rationale for use: The target of Millennium Development Goal 4 is to “Reduce by two thirds, from 1990 to 2015, the under-five mortality rate”. Efforts to improve child survival can be effective only if they are based on reasonably accurate information about the causes of childhood deaths.

Definition: Distribution of main causes of death among children aged < 5 years, expressed as percentage of total deaths.

Method of estimation: WHO regularly receives mortality-by-cause data from Member States, as recorded in national civil registration systems.

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-06-26 12:56:49.0.
<http://apps.who.int/gho/data/node.main.24?lang=en>

52. Exclusive breastfeeding under 6 months, early initiation of breastfeeding, complementary feed (%)

Rationale for use: These indicators belong to a set of indicators whose purpose is to measure infant and young child feeding practices, policies and programmes.

Definition: Exclusive breastfeeding is the proportion of infants 0–5 months of age who are fed exclusively with breast milk. Early initiation of breastfeeding is the percentage of infants who are put to the breast within one hour of birth. Complementary feed is the percentage of children aged 6–8 months who received solid, semi-solid or soft foods in the 24 hours prior to the survey.

Method of estimation: WHO maintains the WHO Global Data Bank on Infant and Young Child Feeding

Source: DHS, MICS, other national household surveys and UNICEF; UNICEF- the State of the World's Children 2013
<http://www.unicef.org/sowc2013/statistics.html>

53. Children 6–59 months of age who received vitamin A supplementation

Rationale for use: Vitamin A supplementation is considered a critically important intervention for child survival owing to the strong evidence that exists of its impact on child mortality. Therefore, measuring the proportion of children who have received vitamin A in the last 6 months is crucial for monitoring coverage of interventions towards the child-survival-related MDGs and strategies.

Definition: proportion of children 6–59 months of age who have received a high-dose vitamin A supplement in the last 6 months.

Methods of estimation: Empirical data.

Source: Data compiled by WHO from Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS), January 2010. Available at: www.measuredhs.com and www.unicef.org/statistics/index_24302.html.

54. Children under 5 years of age with acute respiratory infection and fever (ARI) taken to a health facility

Rationale for use: Respiratory infections are responsible for almost 20% of all under-5 deaths worldwide. The number of under-5s with ARI who are taken to an appropriate health provider is a key indicator for both coverage of intervention and careseeking and provides critical inputs to the monitoring of progress towards the child-survival-related MDGs and strategies.

Definition: Proportion of children aged 0–59 months who had presumed pneumonia (ARI) in the last 2 weeks and were taken to an appropriate health provider.

Methods of estimation: Empirical data.

55. Children aged <5 years with ARI symptoms receiving antibiotics (%)

Rationale for use: Pneumonia accounts for an estimated 18% of deaths among children under five. Appropriate care of the sick child is defined as providers that can correctly diagnose and treat pneumonia. Antibiotics have an essential role in reducing deaths due to pneumonia. Pneumonia prevention and treatment is therefore essential to the achievement of MDG4.

Definition: Percentage of children ages 0-59 months with suspected pneumonia receiving antibiotics.

Method of estimation: WHO compiles empirical data from household surveys.

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-06-26 14:50:54.0.
<http://apps.who.int/gho/data/node.main.38?lang=en>

56. Children under 5 years of age with diarrhoea who received oral rehydration therapy (ORT)

Rationale for use: Diarrhoeal diseases remain one of the major causes of under-5 mortality, accounting for 1.8 million child deaths worldwide, despite all the progress in their management and the undeniable success of oral rehydration therapy (ORT). Therefore, the monitoring of the coverage of this very costeffective intervention is crucial for the monitoring of progress towards the child-survival-related MDGs and strategies.

Definition: Proportion of children aged 0–59 months who had diarrhoea in the last 2 weeks and were treated with oral rehydration salts or an appropriate household solution (ORT).

Methods of estimation: Empirical data.

57. Newborns with low birthweight (%)

Rationale for use: the low-birthweight rate at the population level is an indicator of a public health problem that includes long-term maternal malnutrition, ill-health and poor health care. On an individual basis, low birthweight is an important predictor of newborn health and survival.

Definition: Percentage of live-born infants with birthweight less than 2500 g in a given time period. Low birthweight may be subdivided into very low birthweight (less than 1500 g) and extremely low birthweight (less than 1000 g).

Methods of estimation: Where reliable health service statistics with a high level of coverage exist, percentage of low-birthweight births. For household survey data, different adjustments are made according to the type of information available (numerical birthweight data or subjective assessment by the mother).

Source: UNICEF Global Database on Low Birthweight. New York: UNICEF, 2009.
Available at: www.childinfo.org/low_birthweight_table.php (November 2009 update).

Maternal and newborn health

58. Births attended by skilled health personnel (%)

Rationale for use: All women should have access to skilled care during pregnancy and at delivery to ensure detection and management of complications. Moreover, because it is difficult to measure maternal mortality accurately, model-based maternal mortality ratio (MMR) estimates cannot be used for monitoring short-term trends. The proportion of births attended by skilled health personnel is used as a proxy indicator for this purpose.

Definition: Percentage of live births attended by skilled health personnel in a given period of time.

Methods of estimation: Empirical data from household surveys are used. At a global level, facility data are not used.

Source: WHO Global Database on Maternal Health Indicators, 2009 update. Geneva: WHO, 2009.

Available at: www.who.int/reproductivehealth/global_monitoring/index.html. In order to enhance comparability over time, the reported figures are derived, to the extent possible, from broadly comparable data sources. Therefore, reported figures may not refer to the most recently available data. Refer to the source for more complete information on time trends and metadata.

59. Births by caesarean section (%)

Rationale for use: The proportion of births by caesarean section is an indicator of access to and utilization of health care during childbirth.

Definition: Percentage of births by caesarean section among all live births in a given time period.

Methods of estimation: Empirical data from household surveys.

60. Stillbirth rate (per 1000 total births)

Rationale for use: Stillbirths can occur antepartum or intrapartum. In many cases, stillbirths reflect inadequacies in antenatal care coverage or good quality intrapartum care

Definition:

For international comparison purposes, stillbirths are defined as third trimester fetal deaths (> or = 1000 grams or > or = 28 weeks).

Method of estimation:

For data from countries with civil registration and good coverage, data meeting definition criteria of greater than or equal to 1000 g or 28 completed weeks gestation, are taken directly from civil registration without adjustment. For all other countries, stillbirth rates were estimated using an econometrics model.

Source:

WHO Global Health Observatory Data Repository. Data extracted on 2013-06-26 12:07:00.0.

http://apps.who.int/gho/indicatorregistry/App_Main/view_indicator.aspx?iid=2444

61. Antenatal care coverage (%)

Rationale for use: Antenatal care coverage is an indicator of access and utilization of health care during pregnancy.

Definition: Percentage of women who utilized antenatal care provided by skilled health personnel for reasons related to pregnancy at least once during pregnancy as a percentage of live births in a given time period.

Methods of estimation: Empirical data from household surveys are used. At global level, facility data are not used.

Source: UNICEF Global Database on Maternal Health. New York: UNICEF, 2010.

Available at: www.childinfo.org/antenatal_care_country.php.

62. Postnatal care visit within two days of childbirth (%)

Rationale for use: The majority of maternal and newborn deaths occur within a few hours after birth, mostly within the first 48 hours. Deaths in the newborn period (first 28 days) are a growing proportion of all child deaths. Postnatal care contacts, especially within the first few days following birth, are a critical opportunity for improving maternal and newborn health and survival and for provision of information about birth spacing.

Definition: Percentage of mothers who received postnatal care within two days of childbirth.

Method of estimation: WHO compiles empirical data from household surveys.

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-06-26 15:40:48.0.

<http://apps.who.int/gho/data/node.main.531?lang=en>

63. Percentage of pregnant women with HIV receiving antiretrovirals to prevent mother-to-child transmission (PMTCT)

Rationale for use: In the absence of any preventative interventions, infants born to and breastfed by HIV-infected women have roughly a one-in-three chance of acquiring infection themselves. The purpose of this indicator is to assess progress in preventing mother-to-child transmission of HIV (PMTCT).

Definition: The percentage of HIV-infected pregnant women who received antiretroviral medicines to reduce the risk of mother-to-child transmission, among the estimated number of HIV-infected pregnant women.

Method of estimation: UNAIDS/WHO methods

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-06-26 15:40:48.0.

<http://apps.who.int/gho/data/node.main.574?lang=en>

Gender and women's health (including ageing)**64. Contraceptive prevalence (%)**

Rationale for use: Contraceptive prevalence is an indicator of health, population, development and women's empowerment. It also serves as a proxy measure of access to reproductive health services that are essential for meeting many of the MDGs, especially the child mortality, maternal health, HIV/AIDS and gender-related goals.

Definition: Contraceptive prevalence is the proportion of women of reproductive age who are using (or whose partner is using) a contraceptive method at a given point in time

Methods of estimation: Empirical data only.

Source: World Contraceptive Use 2009. New York: Population Division, Department of Economic and Social Affairs, United Nations Secretariat, 2009 (POP/DB/CP/Rev2009).

65. Unmet need for family planning (%)

Rationale for use: Unmet need for family planning provides a measurement of the ability of women in achieving their desired family size and birth spacing. It also provides an indication of the success of reproductive health programmes in addressing demand for services. Unmet need complements the contraceptive prevalence rate by indicating the additional extent of need to delay or limit births.

Definition: The proportion of women of reproductive age (15-49 years) who are married or in union and who have an unmet need for family planning.

Method of estimation: The United Nations Population Division compiles and updates unmet need for family planning (UMN) data. Data are obtained from surveys including DHS, Fertility and Family Surveys (FFS), Reproductive Health Surveys (RHS) and national surveys based on similar methodologies.

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-06-26 15:40:48.0.

http://apps.who.int/gho/indicatorregistry/App_Main/view_indicator.aspx?iid=6

66. Total fertility rate (per woman)

Rationale for use: Stillbirths can occur antepartum or intrapartum. In many cases, stillbirths reflect inadequacies in antenatal care coverage or good quality intrapartum care.

Definition: The average number of children a hypothetical cohort of women would have at the end of their reproductive period if they were subject during their whole lives to the fertility rates of a given period and if they were not subject to mortality. It is expressed as children per woman.

Method of estimation: Population data are taken from the most recent United Nations Population Division's "World Population Prospects"

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-07-23 13:33:21.0.

http://apps.who.int/gho/indicatorregistry/App_Main/view_indicator.aspx?iid=123

67. Incidence rate of cervical cancer (per 100 000 population)

Rationale for use: Women's health indicator

Definition: Age standardized incidence rate of cervical cancer (per 100 000 population)

Source: GLOBOCAN 2008. International Agency for Research on Cancer (IARC), <http://globocan.iarc.fr/>

68. Prevalence of FGM among daughters (%)

Definition : Percentage of women aged 15-49 with at least one daughter circumcised

Source: DHS, MICS, DHS and other national survey.

69. Prevalence of FGM among women 15-49 (%)

Definition: Percentage of women aged 15-49 who have been cut

Source: UNICEF: Childinfo Monitoring the Situation of Children and Women, http://www.childinfo.org/fgmc_prevalence.php
Data are obtained from surveys including DHS, MICS, DHS and other national survey.

70. Female headed households (%)

Rationale for use: Gender indicator

Definition: Female headed households shows the percentage of households with a female head.

Source: The World Bank. Data obtained from the Demographic and Health Surveys by ICF International.

71. Life expectancy at age 60 (years)

Rationale for use: Life expectancy at age 60 reflects the overall mortality level of a population over 60 years. It summarizes the mortality pattern that prevails across all age groups above 60 years.

Definition: The average number of years that a person of 60 years old could expect to live, if he or she were to pass through life exposed to the sex- and age-specific death rates prevailing at the time of his or her 60 years, for a specific year, in a given country, territory, or geographic area.

Method of estimation: When mortality data from civil registration are available, their quality is assessed; they are adjusted for the level of completeness of registration if necessary and they are directly used to construct the life tables. WHO has developed a model life table using a modified logit system based on about 1800 life tables from vital registration judged to be of good quality to project life tables and to estimate life table using limited number of parameter as input.

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-08-12 15:38:20.0.

<http://apps.who.int/gho/data/view.main.690?lang=en>

Population proportion over 60 (%)

Definition: The percentage of de facto population aged 60 years and older in a country, area or region as of 1 July of the year indicated.

Method of estimation: Population data are taken from the most recent UN Population Division's "World Population Prospects".

Source: UNSD website accessed on July 08, 2013; United Nations Statistics Division based on data published by the United Nations, Department of Economic and Social Affairs, Population Division (2011), <http://www.un.org/esa/population/unpop.htm>

72. Sex ratio (women per 100 men)

Rationale for use: Gender indicator

Definition: Women divided par 100 men

Method of estimation: Calculated by the United Nations Statistics Division based on the given population by sex.

Source: UNSD website accessed on July 08, 2013. United Nations, Department of Economic and Social Affairs, Population Division (2011), *World Population Prospects: The 2010 Revision*. available in <http://www.un.org/esa/population/unpop.htm>

73. Sex ratio in 60+ age group (women per 100 men)

Rationale for use: Ageing indicator

Definition: Women divided par 100 men in 60 and over age group

Method of estimation: Calculated by the United Nations Statistics Division based on the given population by sex.

Source: UNSD website accessed on July 08, 2013. United Nations, Department of Economic and Social Affairs, Population Division (2011), *World Population Prospects: The 2010 Revision*. available in <http://www.un.org/esa/population/unpop.htm>

Neglected tropical diseases

74. Dracunculiasis certification status of countries at the beginning of the year

Rationale for use: WHA Resolutions 44.5, 50.35 and 57.9 on eradication of dracunculiasis.

Definition: It defines the status of certification of countries

WHO classifies countries as:

Endemic for dracunculiasis - country or group of countries where dracunculiasis transmission occurs and where surveillance and control operations are essential.

Countries at the precertification stage - group of countries have reached zero reporting of indigenous cases and where a reliable and extensive surveillance system must be maintained until certification.

Countries not known to have dracunculiasis but yet to be certified - group of countries where the information obtained is not sufficiently clear to ascertain that guinea worm transmission has been definitely interrupted.

Certified free of dracunculiasis - group of countries verified as free of dracunculiasis transmission and certified by WHO following the recommendation of the International Commission for the Certification of Dracunculiasis Eradication (ICCDE). Surveillance should be maintained until global eradication of dracunculiasis is declared.

A country will be considered to have re-established dracunculiasis endemicity if the country has not reported an indigenous case of the disease for >3years, and subsequently indigenous transmission of laboratory confirmed cases is shown to occur in that country for three or more consecutive calendar years.

Method of estimation: WHO maintains a register of countries with different certification status. The countries are certified by WHO based on the recommendations of the International Commission for the Certification of Dracunculiasis Eradication.

Source: WHO; WHO Global Health Observatory Data Repository. Data extracted on 2013-08-14 11:51:24.0.
<http://apps.who.int/gho/data/node.main.A1633?lang=en>

Noncommunicable diseases and conditions

75. Probability of dying between exact ages 30 and 70 from any of cardiovascular disease, cancer, diabetes, or chronic respiratory (%)

Rationale for use: Disease burden from non-communicable diseases (NCDs) among adults - the most economically productive age span - is rapidly increasing in developing countries due to ageing and health transitions. Measuring the risk of dying from target NCDs is important to assess the extent of burden from mortality due NCDs in a population. This indicator has been selected to measure NCD mortality for the "25 by 25" NCD mortality target (see links below).

Definition: Per cent of 30-year-old-people who would die before their 70th birthday from any of cardiovascular disease, cancer, diabetes, or chronic respiratory disease, assuming that s/he would experience current mortality rates at every age and s/he would not die from any other cause of death (e.g., injuries or HIV/AIDS).

Method of estimation: Life tables specifying all-cause mortality rates by age and sex for WHO Member States are developed from available death registration data, sample registration systems (India, China) and data on child and adult mortality from censuses and surveys.

Cause-of-death distributions are estimated from death registration data, and data from population-based epidemiological studies, disease registers and notifications systems for selected specific causes of death. Causes of death for populations without useable death-registration data are estimated using cause-of-death models together with data from population-based epidemiological studies, disease registers and notifications systems.

For additional details on 2008 estimates, refer to 'Summary of methodology for cause of death, 2008' and 'Summary of methodology for child mortality', links provided below.

Probability of death between exact age 30 and exact age 70 was calculated using cause-specific mortality rates in each 5-year age group and standard life table methods.

Source: WHO Global Health Observatory Data Repository. Data extracted on 2013-08-14 12:15:49.0.
<http://apps.who.int/gho/data/node.main.A857?lang=en>

Key determinants of health

Risk factors for health

76. Prevalence of smoking any tobacco product among adults aged 15 years of age or older (%)

Rationale for use: Prevalence of current tobacco smoking among adults is an important measure of the health and economic burden of tobacco, and provides a baseline for evaluating the effectiveness of tobacco control programmes over time. While a more general measure of tobacco use, including both smoked and smokeless products, would be ideal, data limitations restrict the present indicator to smoked tobacco. Occasional tobacco smoking constitutes a significant risk factor for tobacco-related disease, and is therefore included along with daily tobacco smoking.

Definition: Prevalence of current tobacco smoking (including cigarettes, cigars, pipes or any other smoked tobacco products). Current smoking includes both daily and non-daily or occasional smoking.

Methods of estimation: Empirical data only.

Source: Based on WHO Report On The Global Tobacco Epidemic, 2009: Implementing Smoke-Free Environments. Geneva: WHO, 2009. Available at: www.who.int/tobacco/mpower/en/. See Appendix VII: Age-Standardized Prevalence Estimates for WHO Member States, 2006. 'Smoking' is defined as smoking at the time of the survey of any form of tobacco, including cigarettes, cigars, pipes, bidis, etc. and excluding smokeless tobacco.

These figures represent age-standardized prevalence rates for smoking tobacco, and should only be used to draw comparisons of prevalence between countries and between men and women within a country. They should not be used to calculate the number of smokers in a country, region, income group or globally.

77. Alcohol per capita consumption (litres per person) among adults aged 15 years of age or older

Rationale for use: The recorded alcohol per capita consumption is part of a core set of indicators, whose purpose is to monitor the magnitude, pattern and trends of alcohol consumption in the adult population.

Definition: Recorded APC is defined as the recorded amount of alcohol consumed per adult (15+ years) over a calendar year in a country, in litres of pure alcohol. The indicator only takes into account the consumption which is recorded from production, import, export, and sales data often via taxation. Numerator: The amount of recorded alcohol consumed per adult (15+ years) during a calendar year, in litres of pure alcohol. Denominator: Midyear resident population (15+ years) for the same calendar year, UN World Population Prospects, medium variant.

Method of estimation: Adult per capita consumption data exist for almost all countries. Regional and global estimates are calculated as a population weighted average of country data.

Sources: Administrative reporting system

Available at <http://apps.who.int/gho/data/node.main.62?lang=en>

78. Raised fasting blood glucose among adults aged 25 years or older (%)

Definition: Percent of defined population with fasting glucose ≥ 126 mg/dl (7.0 mmol/l) or on medication for raised blood glucose.

Method of estimation: Based on measured fasting blood glucose.

Sources: Population-based surveys, surveillance systems

Available at <http://apps.who.int/gho/data/node.main.NCD56?lang=en>

79. Raised blood pressure among adults aged 25 years or older (%)

Definition: Prevalence of raised blood pressure (SBP ≥ 140 or DBP ≥ 90).

Method of estimation: Based on measured blood pressure. If multiple blood pressure readings were taken, first reading per participant was dropped and average of remaining readings was used.

Sources: Population-based surveys, surveillance systems

Available at <http://apps.who.int/gho/data/node.main.NCD56?lang=en>

80. Raised total cholesterol among adults aged 25 years or older (%)

Definition: Percentage of defined population with total cholesterol ≥ 240 mg/dl (6.2 mmol/l).

Method of estimation: Based on measured total cholesterol.

Sources: Population-based surveys, surveillance systems

Available at <http://apps.who.int/gho/data/node.main.A887?lang=en>

81. Physical inactivity among adults aged 15 years of age or older (%)

Definition: Percent of defined population attaining less than 5 times 30 minutes of moderate activity per week, or less than 3 times 20 minutes of vigorous activity per week, or equivalent.

Method of estimation: Based on self-reported physical activity captured using the GPAQ (Global Physical Activity Questionnaire), the IPAQ (International Physical Activity Questionnaire) or a similar questionnaire covering activity at work/in the household, for transport, and during leisure time.

Sources: Population-based surveys, surveillance systems

Available at <http://apps.who.int/gho/data/node.main.A893?lang=en>

The physical environment

82. Population with:

- sustainable access to an improved water source (%)

- access to improved sanitation (%)

Rationale for use: Access to drinking water and improved sanitation is a fundamental need and a human right vital for the dignity and health of all people. The health and economic benefits of improved water supply to households and individuals (especially children) are well documented. Both indicators are used to monitor progress towards the MDGs.

Definition: Access to an improved water source is the percentage of the population with access to an improved drinking water source in a given year. Access to improved sanitation is the percentage of the population with access to improved sanitation in a given year.

Methods of estimation: Estimates are generated through analysis of survey data and linear regression of data points.

Coverage estimates are updated every 2 years.

Source: WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation. Geneva: WHO and UNICEF, 2010.

Available at: www.wssinfo.org/en/welcome.html.

83. Population living in urban areas (%)

Definition: The percentage of de facto population living in areas classified as urban according to the criteria used by each area or country as of 1 July of the year indicated.

Method of estimation: Population data are taken from the most recent UN Population Division's "World Population Prospects".

Sources: Civil registration, Population census

Available at <http://apps.who.int/gho/data/node.main.POP107?lang=en>

84. Population using solid fuels (%)

Rationale for use: The use of solid fuels in households is associated with increased mortality from pneumonia and other acute lower respiratory diseases among children, as well as increased mortality from chronic obstructive pulmonary disease and lung cancer (where coal is used) among adults. It is also an MDG indicator.

Definition: Percentage of population using solid fuels.

Methods of estimation: The data from surveys and censuses are used as reported in the surveys and censuses. All countries with a Gross National Income (GNI) per capita above US\$ 10 500 are assumed to have made a complete transition to cooking with non-solid fuels. For low- and middle income countries with a GNI per capita below US\$ 10 500 and for which no household solid fuel use data are available, a regression model based on GNI, percentage of rural population, and location or non-location within the Eastern Mediterranean Region is used to estimate the indicator. These estimates use methods developed and implemented by the WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation. Where solid fuel use information is available for two or more separate years (spaced at least 5 years apart) linear regression is performed. The linear regression line is extrapolated up to 2 years after the latest survey point and up to 2 years before the earliest survey point. Outside these time limits, the extrapolated regression line is flat for 4 years in either direction. Where coverage reaches 0% or 100%, a horizontal line is drawn from the year before coverage reaches 0% or 100%. For countries with solid fuel use at less than 5%, 0% is assumed for the calculation of regional or global aggregates; for countries with more than 95%, 95% is assumed in the calculation of the aggregate.

Source: WHO Household Energy Database. Geneva: WHO, 2010.

Available at: www.who.int/indoorair/health_impacts/he_database/en/.

Food safety and nutrition**85. Children under 5 years of age**

- underweight for age (%)

- stunted for age (%)

- overweight for age (%)

Rationale for use: All three indicators measure growth in young children. Child growth is internationally recognized as an important public health indicator for monitoring nutritional status and health in populations. In addition, children who suffer from growth retardation as a result of poor diets and/or recurrent infections tend to have greater risks of illness and death.

Definition: Percentage of children stunted describes how many children under 5 years have a height-for-age below minus two standard deviations of the National Center for Health Statistics (NCHS)/WHO reference median. Percentage of children underweight describes how many children under 5 years have a weight-for-age below minus two standard deviations of the NCHS/WHO reference median. Percentage of children overweight describes how many children under 5 years have a weight-for-height above two standard deviations of the NCHS/WHO reference median.

Methods of estimation: Empirical values. Several countries have limited data for recent years and current estimations are made using models that make projections based on past trends.

Source: Global Database on Child Growth and Malnutrition. Geneva: WHO, 2009.

Available at: www.who.int/nutgrowthdb/database/en. Prevalence estimates are based on WHO standards.

86. Adults aged 20 years or older who are obese (%)

Rationale for use: The prevalence of overweight and obesity in adults has been increasing globally. Obese adults (BMI \geq 30.0 kg/m²) are at increased risk of adverse metabolic outcomes, including increased blood pressure, cholesterol, triglycerides and insulin resistance. Subsequently, an increase in BMI exponentially increases the risk of noncommunicable diseases (NCDs), such as coronary heart disease, ischaemic stroke and type 2 diabetes mellitus. Raised BMI is also associated with an increased risk of cancer.

Definition: Percentage of adults classified as obese (BMI \geq 30.0 kg/m²) among total adult population (20 years or older).

Methods of estimation: Estimates are still under development and will be published later in 2006. Only nationally representative surveys with either anthropometric data collection or self-reported weight and height (mostly in high income countries) are included in the 2006 World Health Statistics. Comparisons between countries may be limited owing to differences in sample characteristics or survey years.

Source: Global Database on Body Mass Index. Geneva, WHO, 2010. Available at: www.who.int/bmi.

87. Annual growth rate (in %) of population

Definition: Average exponential rate of annual growth of the population over a given period.

Methods of estimation: Population data are taken from the most recent UN Population Division's "World Population Prospects".

Sources: Civil registration, Population census

Available at <http://apps.who.int/gho/data/node.main.POP107?lang=en>

Social determinants

Gender equity

88. Seats held by women in national parliaments (%)

Rationale for use: Gender indicator

Definition: Percentage of parliamentary seats in Single or Lower chamber occupied by women

Method of estimation: The percentage of parliamentary seats occupied by women is calculated for the lower chamber in countries with a bicameral assembly only. The numbers shown reflect changes, if any, after the most recent election prior to those dates, such as results of by-election or replacements following a parliamentarian's resignation or death.

Source: UNSD website accessed on July 08, 2013. Data from Inter-Parliamentary Union. Women in National Parliaments. Situation, available from IPU website. <http://www.ipu.org/english/home.htm>

Basic data and statistics are at the core of all health systems. Without them, it would be impossible to analyze evidence and extract action-orientated knowledge for decision making.

The development of an African Health Observatory and national health observatories aim to narrow the knowledge gap and strengthen health systems in the African Region by providing easy access to high quality information, evidence and knowledge, as well as facilitate their use for policy and decision making.

WHO Health Situation Analysis in the Africa Region: Atlas of African Health Statistics, 2014 presents in numerical and graphical formats the best data available for key health indicators in the 47 countries of WHO's African Region.

With the continued input and collaboration of the African countries, this publication and its future editions will be a significant, constantly updated information product of the Observatory.
